I wud have to agree with sturdy mast also buy 2 thrust bearings and install in your tower and use a tailtwister 2 rotor.For mast use the heavy gas line that fits in your tower.that is why i said 2 thrust bearing cause the mast and antenna are heavy especially if u use gas line
there is the same setup here in my town and the gas line has never broke and the thrust bearings have kept the rotor in use for 12 years now later mik

>does anybody know of a better group?

There used to be a kit available from one of those kit places, but I
believe it was pulled. Ebay probably wouldn't let one be posted.
Try at http://www.radar-laser-jammers.com/. They're kind of expensive
if you're just going to be playing around with the police. One of the
major electronics magazines had plans about five or six years ago.
Your local library might have back issues. I think there were also
plans forthose little gizmos that let you broadcast a radar signal to
activate all the detectors in a nearby area.

>
>
>

I am probably going to tell you more than you really want to know about co-phasing but some of it may be of use to you.

Given that you have two antennas with decent rf grounds and the body or truck bed is in fact connected to the rest of the vehicle, either of the two should reflect about 50 ohms matching the coax and the radio perfecto mundo. The problem arises when you go to attach two to the rig because two 50 ohm loads in parallel give 25 ohms and your radio will throw up. Magic time.

Obviously the first step is to get each antenna working properly and more or less identically.

To get a proper impedence match, it is necessary to fake the transmitter into seeing two 100 ohm loads and what you see being done is what is called (no exam given, just so you know) a 'quarter-wave Q section'. And a handy tool it be.

By putting a quarter-wavelength (more on this later) of a different impedence coax between a load and the feed coax the impedence at the end will be raised; this is why the phasing harness is made of RG-59 a 75 ohm variety. I will spare you the algebra but the output bears the same relationship to 75 ohms only backwards as the input does so if 75 is 1.5 times 50 the output will match 112.5 ohms, close enough to 100 for government work and large mutual insurance companies. This particular stunt is often used to match loops and low folded-dipoles on the ham bands.

So what they are doing is creating two 100 ohm loads to be paralleled into 50 and as it happens making sure each antenna takes half the power via a deliberate mismatch. No big deal. So now comes the question of what the term 'quarter-wave' may mean.

In free space .25l is 246/f(MHz) but coax ain't free space. Every coax has what is called a 'velocity factor' which for RG59 can vary a lot but is more than likely fairly close to 0.66 but can go to about 0.8 for foam

types and God Knows for el cheapo supremo or more likely a decent brand made for the CATV market.

Not a huge big deal unless you are brewing your own. Use the harness as given if at all possible.

But first get the antennas working pretty much the same on both sides. You are on the right track.

Some have suggested and I tend to concur that you might be happier with an active antenna and a decoration. When you are hauling a 45 foot aluminum box around you really need to have antennas on both sides but there is a price to pay and the price is directionality. You may not like what you get from a non-standard installation on something that does not say Freightliner on it.

I have access to an Agilent 8714ES RF Network Analyzer. You can monitor the match with that unit and it'll read out in SWR.

You can also do it by tuning and watching the output. You should be able to peak the power "throughput" and when you do... the power output will be the highest, and the device heating will be the lowest.

Yep, it was. 2001 was a BAD year. Bad because of 9-11. Bad because of the Govt./ foreign & federal reserve bankers controlled economy put us worse in a DEPRESSION (it has bin SLOW)! Bad because more of our God given Constitutionally secured Liberties have gone down the TUBES ! Bad because the govt. STOLE a Church building & property in Indianapolis in violation of the 1st Amendment. Bad because most people seem to be LOST IN SPACE because they have forgot the True God, Jesus Christ. So that is the 2001 Space Oddasee! The remedy: Repent from SIN & believe The Gospel (good news) of The Lord Jesus Christ! 2 Chronicles 7:14 IS the answer!!!!!! More of Deuteronomy 28 is what we will have if we won't!!!!!
Dave!!!!!!!!!!!!!!!!

You are correct - _Kotko v Briney_ was a 1971 Supreme Court of Iowa
case. The interesting sequel was that the looter later had to go to
bat for the farmer to keep him out of bankruptcy long enough to get
the damage award paid.

To us westerners, all states between Pensylvania and Nevada
blend into one.

And a happy hangover to all heheh.

I want to take this time to say that this year has had many good moments, and many bad. At this time, I would like to remember those who lost their lives on September 11. Both those innocent victems on the planes, and those in the towers, and the brave men and women who went in to save them. I was honored to have been asked to help out with the disaster relief effort going on there, and while I was there I was again honored to have been asked to be at the memorial ceremony at ground zero on Sunday October 28th. I am a different person than I was before 09-11. Being in NYC and helping there, meeting the survivors, and hearing their stories, has forever changed me for better or for worse, I feel for better. I think I have matured some, although my friends may disagree, but I have had a hard time letting them know how much this has all effected me.

Anyway, I hope everyone out there has a safe and happy holiday. I will be sitting here at home, playing with my computer, and my radios, sober, I am not in a celebrating mood.

After you have done the 459 miles it takes to get 'Welcome to Wyoming'
you would be forgiven if you blended it together. Some years ago the
Game, Forestation, Parks, and Tourism Commission (no kidding) came up with
the infamous Nebraskaland, Where the West Begins slogan complete with the
traditional oxen, covered wagon, hardy pioneers etc heading into the sun.
Some of the locals had a case of the tights with the grand poobah thereof
and came up with a bumper sticker of their own.

It featured the same oxen but near death from exhaustion, a covered wagon
with four wheels going in five directions, pioneers that looked like
Snuffy Smith heading into a blazing sun with the caption: Nebraskaland,
Where the East Peters Out. Closer to the truth.

Besides most Nebraskans came on the train after a Kunte Kinte Klass ride on a steamship paid for by a railroad and were kicked off the train. The covered wagons ran only about 6 weeks a year on the Oregon trail at any given point, were rarely out of sight of each other, and the largest cause of death was being shot in the back when the idiot behind you with Grandpa's old percussion cap rifle left it in full-cock and hit a bump. Phil, you are now living among the progeny of the survivors of that bit of idiocy -- be careful!

Dick, Bionic Klutz

That won't tell you if you are clipping or not, and it certainly won't
tell you if you are actually running linear. Tuning is easy, but if
there is no bias you can tune it all you want and it will still suck.

Time for extreme measures Sharkie, a tax deduction is at stake!

Actually, first children tend to be born late after a lot of labor time at a stupid hour of the morning so there is not a big hurry. If you want to be nice to your wife, be damned sure she gets a lot of sleep: a, she is going to need it. and b, a tired woman does not have pleasant labor -- you cant get your muscles working when you are pooped and she can't either.

Wouldn't hurt you to get some sleep either, I went to sleep standing in the doorway of Judy's room. After the staff marveled at the sight of a big dude managing to snore in a vertical position without collapsing they took me down to the Fathers Only! No one under 14 allowed Room for an hour of shuteye until the Clampetts, kids and all, arrived to brighten the day. Before proceeding to clear the room by throwing them in the general vicinity of the door without noting the status of the door, the phone rang and I was the daddy of a son who grew to be larger than the old man. I then proceeded home to notify inlaws etc blowing out the generator on the car in the process. Generally one of those sweet-and-sour days.

And for God's sake, don't paint anything. Terminally pregnant women have the worst color taste imaginable and when you bring her home the reaction

will not be gratitude but 'Good Lord, I asked for that color?' Catch up on your sleep, you will need it, too.

And do not get into Provider Mode. Enjoy the kid, marvel at the growth of the little human, and enjoy the one and only chance you will ever have.

Dick N&#65533;BK

Yes ball and chain it can be repaired I take it it is the newer type and not
the fliptype , ether A driver in the section or a led display took A crap.
If you would like you may send me the radio and I can efface repairs.

LOL! They must've been calves, cuz I still can't see how he got 'em in
'ere> I can just see it
now; old car going down the road mashed down to the axles, bumper within
inches of the
ground. Springs broken. Tires rubbing the fenders. Maybe the deputy,
meeting this car
with "cows" in it, thought they spiked his coffee at the diner, and said to
himself, "I'm NOT
gonna say a word to anybody about this because they wouldn't believe it!"

IT is still very funny. And I believe people will try anything once.

Jerry

OK one more time. To try to get things off of dead center, make the device an SCR because we both know how they work. With the input connected with appropriate voltage drop to the gate but no RC delay you will get 180 degrees of an AC cycle and you have just created the world's most expensive half-wave rectifier. On the scope you see half a sine wave and all is right with the world. Goes from 0 to about 170 volts peak.

Now run this thru a transformer, 1:1 nothing special, and out will come an interrupted AC that will go from -85 to +85. The famous flywheel effect in action and in fact it will make an attempt at filling the hole if there is enough iron, load, and the match is right. But tanks at 60 Hz tend to the large.

OK, now set the RC gate delay on your lite dimmer so that the input sine wave is at about 30 volts before the gate breaks over. Not a lot changes but the hole is now a bit bigger and you get about 155 P-P instead of 170 but things still look pretty much as expected. Think about this one a while. Changing the SCR to a transistor only changes things by cutting off below 30 volts on the backside of the sine curve as well as the transistor does not have the avalanche effect. You now have 140 P-P.

Now for Jack Diddley let the input vary from 0 to 340 peak over a 1Hz cycle and put the whole second on the screen at the transformer output. When you do this you will see that when the input allows it, you get a 60 Hz output that can be up to 155volts or 310 P-P with a large gaping gap whenever the 1 Hz overlay does not allow the input over 30 volts. Contemplate navel some more. Do this with and without the 30 volt RC delay.

Do it on paper, it isn't that hard. Get yourself a visual look at what you are doing and draw your own conclusions. Hell, fill in the flywheel if it will make you happy but you cannot have a bottom without a top.

Go ye and sin some more.

It isn't that bad, Jerry. Say something like 250-400 max for each heifer in a six passenger car and they did not bring any luggage. Probably made one or two ride in the trunk.

What amazes me is the amount of racket he had to have made getting them in. Who needs the phone, just open the window at the county jail. Can't believe the deputy wasn't there watching for most of it.

But with the meth freaks and their well-known paranoia a deputy is well-advised to pick his spots for any kind of bust.

You know Frank, that's your problem
and you're little friends problem. You try to read
something else into it other than what was intended.
I'm sorry Richard didn't know I already had a daughter,
you knew that, but you try to put some sort of sinister
spin on it. You could've said something along the
lines of he already has one, but again you put a
spin on it like I was trying to deceive him.
My hope, if you as an intelligent person could understand,
was to have the first baby of the year, but you thought
of only trying to say I was deceiving him, it's just shows
how paranoid you really are, oh well.
I am impressed though that you keep all my
posts, yours on the other hand have been in my kill
file for months, so no such luck for you.

Have a Safe & Happy New Year Frank,

This is a good one to avoid. There were (legal) systems a few years back that used passive methods (modulated and reflected the impinging signal), but were outlawed. The local police take a dim view of those things. Radar detectors are one thing, jammers are another. I remember we had one kid nailed and expelled from college over this back when I was in college.

When you vaguely refer only to "the first one", there
really isn't much room to interpret it any other way,
shark. Is that what you intended? To be intentionally
vague? Probably not, you aren't that bright.

> I am impressed though that you keep all my
>posts,

I do? I thought I got it off of Google. Silly me!

TX Penal Code
9.42. Deadly Force to Protect Property
A person is justified in using deadly force against another to
protect land or tangible, movable property:
(1) if he would be justified in using force against the other
under Section 9.41; and
(2) when and to the degree he reasonably believes the deadly
force is immediately necessary:
(A) to prevent the other's imminent commission of arson,
burglary, robbery, aggravated robbery, theft during the nighttime, or
criminal mischief during the nighttime; or
(B) to prevent the other who is fleeing immediately after
committing burglary, robbery, aggravated robbery, or theft during the
nighttime from escaping with the property; and
(3) he reasonably believes that:
(A) the land or property cannot be protected or recovered by any
other means; or
(B) the use of force other than deadly force to protect or
recover the land or property would expose the actor or another to a
substantial risk of death or serious bodily injury.

Going hand to hand against someone trying to rob you is considered too
dangerous, and given the rarity of recovering stolen property, that
rarely enters the picture except in cases of something that's just too
obvious for them to get far with it. (The only case that comes to
mind under that exception is the guy who had his 10ft tall fiberglass
cow on a trailer stolen repeatedly - it was always recovered within 48
hours...where in the hell would they hide it, and what could they do
with it that wouldn't result in being seen?)

Not too uncommon if the person was one of the local Sheriff's least
favorite customers. IIRC, one guy was determined to have run himself
through an industrial chipper-shredder.

The only real evidence in favor of that determination was the marks on
the inside of the chute from when he tried to pull himself out,
showing that he was definitely alive when he went in.

generally verticle is best for "local" trafic since most bases run verticle antennas,and all your mobile trafic is verticle. horizontal is better for shooting skip because you dont have to try to "listen through" the local verticle "noise",and by the time your signal has "bounced" it is no longer just horizontal or verticle.so those people out in skip land can recieve your signal whether they are on verticle or horizontal. but why live with out the benifits of both? there are some excellent dual-polarity beams out there that are 1) cheap 2) perform well 3) work well with limited space(if that is a consideration) im talking about either the PDL-2 or the MACO M-103 H/V. (there are others on the market, i just listed these as an example) hope this helps. good luck,good dx-ing elpasogunslinger

Some years ago a guy who actually worked on the blessed things built up a
unit that would cause the old X-band stuff to read whatever he chose, 23.5
Hz per mph sticks in my mind FMing a Gunn diode. He found that it slowed
his passage into the city by setting off every radar detector for miles
and when he was ticketed for 56 in a 30 it went into the trash.

Thanks Everybody.

Some of the truck drivers say you can't beat a depth finder.
They mount it on the dash, and your correct you don't
want a jammer that will indicate 56 on police radar all the time.

I was thinking about just a lot of trash into the signal
so no reading would be the result.
How about even automatic door opener?

Every radar detector I have had goes crazy when I get close (1000 ft)
Pump up the output power and ??

I don't know really what I'm doing. If it was just paying a speeding
ticket, that's no problem. It's the insurance that really hurts.

TIA

Derek

Beams depend a bit on what your problem is and what it might be in Norway I have no clue.

Unless you wish to talk with mobile stations, most people use horizontal or 'flat-side' because it picks up a bit less man-made noise. But a lot of beams are available that can do both.

Beams are measured in 'forward gain' and in 'front-to-back ratio' and it is here you have to know why you are putting a lot of time and money into hanging an aluminum hairbrush. Living as I do in the middle of the US I am far more interested in the beam's ability to reject signals from the opposite coast than in its ability to concentrate my transmit signal; you may well have similar problems with Russians.

Unfortunately, beam manufacturers tell you what they want you to know. I might look at an antenna with remarkable f-b which in fact it has at 180 degrees but at 160 and 200 is useless.
a great discussion if you are really into this is at http://www.cebik.com under 'I want to build a 3-element Yagi'.

Structural integrity is a real issue both in the beam itself and the supporting structure; do not get cheap with the support or you will find the whole thing sticking out of your roof. And a lot of antennas will not take a 100 kph wind by themselves let alone at the end of a mast.

When you go to selecting or building one, remember every antenna is a compromise among a lot of factors and the fact is that CB antenna manufacturers do have bills to pay so they are going to be more interested in separating you from your cash than telling you the entire truth. And you have some unique climate problems, everyone does. You have access to marine clamps etc. which while not inexpensive do the job better than what you are likely to get in the shipping carton with the antenna.

Hey guys, is there a decent version of the old PDL2 still around. Sounds to me like it would be a great way for T to become Big-T.

The ability of radar guns to pick up trash is legendary. Basically they
are a continuously running oscillator at, in the case of K band, at 24.525
GHz more or less. When he points it at you a reflected signal returns,
with any luck from you and not the aluminum box topping the hill a mile
away in the other direction, that is frequency shifted by your speed.
This produces an audio tone in the FM receiver which is counted and
divided by the appropriate factor, the 23.5 Hz per mph I think, to give
him the readout. Being FM the strongest reflection wins the whole pot, it
is called the 'capture effect', so trashing it is not really the way to

go. That is why they are calibrated with a tuning fork, it is the beat note rather than the freq that determines its readout.

But the only tuned circuit in the beast is the horn so they can be had by a lot of things. I was once stopped in the middle of a 2-meter QSO by a county guy wanting to know how I could make his gun read 98 mph when it was pretty plain I wasn't doing 98 mph. There are a lot of horror stories of cows clocked at 67 mph etc.

Having spent 25 years as a cubical rat for an insurance company my sympathies are with you up to a point. I might suggest to you that while there most certainly are 'ticket machines' among the gendarmes most of them are interested in keeping people alive far more than generating revenue; they have a lot of choice of who and when to spread joy and happiness. So the trick if you have a heavy foot and places to go is to learn how and when to speed. What you pilot is a factor; look like a snot-nosed kid with his hat on backwards and pubic hair around the mouth with his lo-rider 49 Desoto and you are in a heap of trouble, son. That is simply the way it is. Weave in and out or get impatient in traffic that is going where it is going without your help and you will be selected. You project an attitude and it is the attytude that gets you busted far more than your foot. And the friendly underwriter, likely an overworked idiot, at Galactic Interplanetary Mutual (GIP-M) is looking for the same attytude to whatever extent a piece of paper can provide the evidence.

The problem, of course, is that to some extent both tickets and accidents are random events so the more you drive the more you get; merit-rating is an overworked concept. But when some MBA corelates tickets to accidents and finds that they are related it is damned hard to tell him otherwise. But then your base rate does not take annual mileage into account anyway (commercial auto most certainly does) so the ticket surcharge for the group, not you, gets the rate somewhere closer to what it should have been to begin with. Let me tell you about Physical Damage (collision and comp) rate structures and I'll have you believing in the Tooth Fairy if you buy the concepts; but it does in general get the right money from the right people over time so WTH.

The best advice I can give you is to put your goanies in the glove box when driving a vehicle.

Dick NBK

84. Antenna Specialist PDL-II dual polarity antenna

Newsgroup: rec.radio.cb
Date: 2002-01-01 17:39:55 UTC
From: KAXN-9546 <ab2hr@arrl.net>
Message-ID: <s3t33uc9uuh02n8fc80l5md855pcbgjsmd@4ax.com>
Source record: 110420

Hey folks, friend of mine has one of these, and he's thinking
of selling it. It's a dual quad with two feed points, allowing the
operator to select vertical, horizontal, or horizontal AND vertical
polarization. 12 dBi forward gain, and about a 5 ft boom. This is an
11 meter beam that can be turned with a "medium" duty rotor. The
antenna has been used for 1 1/2 years and comes with a Para Dynamic
PDC4-DX antenna switch box (for selecting polarization). The link
following has a picture of the antenna and supplemental information,
http://www.antenna.com/cb_cat/cbpg01.html. Would anyone out there be
able to provide a typical selling price for this antenna? Will also
entertain offers on the antenna, with the understanding that I am not
the individual selling, I am helping a friend.
Also available are a 4 section (approx 40 ft) aluminum tower
with user fabricated tip-over hinge on the bottom section. Make of
tower is unknown. He's also got a Archerton 1225 antenna rotator and
control unit (3 control wire type).
Anyway, the guy doesn't know what the antenna itself is worth,
and I told him I'd see if I could get an idea of what a good asking
price would be. The tower and the rest of it he's got an idea of what
to ask (think he wants $300 or so for the tower and probably $50-$75
for the rotor).
Thanks for your time!

Not really Tim,
Those posts were done using a hotmail
account as a return addy. After talking
with hotmail on the phone, those are
phony hotmail accounts and as such
forgeries to hotmail.

"Hotmail members cannot post directly to newsgroups but must go through an
independent news-posting service or use another e-mail program.

I have actively pursued legal action against many individuals who forge
addresses from the Hotmail domain. Please help us by forwarding all
unsolicited e-mail with the Hotmail domain name in the headers or bodies to:
abuse@hotmail.com

I encourage you to go to the following links to learn more about spam and
forged message headers, and how to complain about e-mail abuse:

The Anti-Spam HOWTO:
http://www.cauce.org/
Spam FAQ:
http://www.bluemarble.net/~scotty/forgery.html

So if they continue to use phony
hotmail addys, they will find themselves
in a lot a trouble (if they could beat the
feds, what kind of chance would the little
guy have)

I hope you had a Happy New Years,

Landshark

Man you got that right,
When my first was born, nothing but
light brown hair. A year later I grew a
beard, it was all gray at the bottom.
Now a little gray is starting to show
in the mustache and top of the head.

I could care less Mopar,
You know he does give answers to cb questions
and seems to know more than my little buddy,
but he has this paranoia thing. I mean when
we we're discussing law & rules, he went out
on this tirade of how he has changed the city
with his good doings. That wasn't what I was talking
about, there is a difference between the definition
of rule and law, he admitted it some months later
after I kill filed him.
Again, he is just pissed because I'm still here
talking with most people. It's sort of like when a
politician is losing in the polls, he resorts to
mudslinging to bring his name into the limelight.

Yes. your right, but again I assumed Richard knew
I had a daughter. Why does it bother you so?
How does what I posted about having a baby
affect you?

> > I am impressed though that you keep all my
> >posts,
>
> I do? I thought I got it off of Google. Silly me!
>

Why Yes silly you, what on earth would posses you
to take time and do a google search to see if I have
mentioned I had a daughter? I haven't mentioned you
or said anything about you in months and all of a
sudden you are concerned on the birth of my wife's
and mine second child?

ing about luck? And luck for what?
> You are being really vague again, sharkie.

>

Not really, I'll say it in more lay-man terms for you:
I don't care what you type, that's why I kill filed
you. You on the other hand still want to read
my posts, so it's your bad luck about that, not mine.

> > Have a Safe & Happy New Year Frank,
> >
> > Landshark
>
> Ah, the token well-wishing to avoid sounding totally
> embittered. That's ok sharkie, we know better.

Yes I'm sure all of your multiple personalities do
know better. But I thought about ending the year
on a more upward note, but you want to start
right where you left off.

Actually Frank by the e-mails I've had, a fair amount
of people care. Of course only the people that forge and
are protecting the forgers don't care. I notice your back
to using CET, I thought it was so spam infested you dropped
them. I also see you want to by pass kill files, otherwise
you wouldn't have changed your screen nic, to which also
you have said you don't do. Frank, one of your personalites
are breaking your rules.

Landshark

PS. This little alias has also been added to file &
Kill File.

Beams aren't popular on CB cuz you want to be loud in ALL directions
not just ONE. The whole idea of CB is not to let other people use the
channel your on!

Oh come on Landshark no isp enforces those rules, they can't. There
must be a million people who post with made up domain names like
SDJones@stalag13.com, you know? You are wasting your time trying to
enforce a minor enfraction. Have you ever jay walked? Or gone 56 in
55 zone? Same thing. Why are you obsessed with trying to punish people
for minor offenses? Barney Fife is what you are. I am surprised that
Jay Mojave doesnt laugh in your face. You sould like you got a pencil
protector in your pocket crying "i'm telling on you" in a high whiny
voice. You have really changed Landshark. You are the opposite of what
cb is about.

Hello TM:

Beam Antennas work great! The beam antenna is the tip of the ice burg as far as cost is concerned. The cost of a good tower, rotor, coax, and the time and installation involved is the unseen part of the ice burg.

There are beam antennas that have both Vertical and Horizontal polarization, that allow you to switch between the two polarities for the best signal.

A lot of operators say to have a good antenna, and use a beam instead of using higher power. But with a beam antenna, and higher power will really get great results.

Here are few beam antenna web sites:

http://www.signalengineering.com/
http://www.jogunn.com/
http://www.majestic-comm.com/assembly/index.htm

Good Lord, why? Look up GMRS, the old Class A CB which shares the channels if you are serious.

I guess the denizens of a set of garbage freqs in the lo-VHF spectrum might be forgiven for automatically assuming UHF FM is more or less the same: it is not by a long shot.

UHF, ultra high frequencies with an antenna length of about 6 inches not nine feet. At UHF there ain't no substitute for altitude pure and simple. If you can't see it you can't work it, period. Power is not really a consideration and 1 watt will do all you need done. About the only propagation oddity you will experience is on the morning fogs along the river bottoms. Antennas are the whole name of the game.

FM. This means that the transmitter has to spit the deviation the receiver is expecting to hear or you sound like crap if you are intelligible at all so keep your grubby fingers off the modulation limiter. You cannot set it by ear, BTW. For whatever else it might be, AM is far more forgiving of idiocy than FM is as has been proven on CB many, many times. You can crap up an FM rig to needing professional help in a heartbeat.

Live with what you bought. Turn your cap around right, shave the pubic hair off your face, and realize you are not about to be the biggest cock on the block on UHF FM.

Hehe, nice comment !

No offence, i am sure the link the other fellow gave me might has some
useful info, but about modifying a FT817 i am not
so sure.. To make people go for a site with no chance of getting wiser,
well, i have no further comment...

So of course then, my fellow law-breakers out there, if anyone comes up with
an idea of modifying TX/RX-freq
a FT817 with japanese serialnumber, i am all ears :-)

Until then, have a nice day.

T.

The key here is the use of a beam. If used for locals, a lot of them won't be in the front lobe anyways - plus, mobils will be moving around. A good single vertical will probably serve better for local use.

If someone is stealing a bicycle that your kid left in the open
front yard, you would be well advised to think twice before
shooting the perp in the back as he pedaled away.

However, if someone has broken into your home, you could
rationally justify a fear of bodily injury or death.

I have a Texas concealed carry permit. We were taught that using
deadly force on someone in a publicly accessible driveway where
only property is involved can cause more civil problems than
the property is worth. Even if it is a justifiable act under
criminal law, civil law may have a different take on it. The
cost of defending oneself in civil court may cost more than
the property is worth.

Read Richard McCollum's response to your post. Consider this experiment. Turn on your AM radio (does anyone listen to this much anymore?) and see how far away you can receive. I know that here, in Rochester, NY, I can easily listen to WABC out of NYC (during the daytime - across the country at night if I'm lucky). OK, now turn on your FM radio. Lots of luck. With FM broadcast stations running 50000 watts, you'll have a tough time picking up anything more than 100 (maybe, just maybe 150 with a good outside antenna) miles away. Also consider, FM broadcasters do not have antennas mounted at ground level. Most are on high hills and/or have towers hundreds of feet high to get what signal range they have. Take an unmodified FRS unit vs one that someone has turned the deviation up on so it's 'loud'. Take both that and an unmodified FRS unit with you and move away from someone with a third FRS unit. Funny, the range of both the modified and unmodified units die about the same place. Yes, it is possible to get a lot of range. Start with 1000 to 1500 watts, add a HUGE antenna array that you can rotate both horizontally and vertically, change your mode from FM to CW (POSSIBLY ssb), and have a ball - but only when the moon is visible between your station and another similarly equipped station. Then, properly licensed, you can work moonbounce. UHF is quite different from HF. You will not be able to wipe out a channel for thousands (or hundreds, or even tens) of miles, even with a kilowatt.

FWIW arguably the best all round detector is the Valentine.

You get what you pay for.

As far as jammers go. I've played with a few even over in your country years back.

You can pay a lot for a pile of crap so best try and find someone who can personally recommend in your area as there seems to be several different radar bands used even today.

Phil / London, UK

Your only choice to inmrove FRS radio performance is to get to higher ground my friend, UHF is line - of - sight. Only other alternative is one of those mobile units they have approved for cars with the radio connected to a mag mount antenna. But even then it is same power and antenna size. If you want to get better performance get a GMRS license.

Yeah,

And if the perp comes in while I am at home, and I hear him, he'll get his butt filled with
12 ga buckshot! One less "poor ole criminal" for the liberals to force me to keep up in
prison.

LOL this guy really makes me laugh. he lies thn wants to balme everyone else for him getting caught I honestly think he has some serious problems. Hey remember when he got caught in the alt.sex NG he blamed everyone but himself... It is time you take up for your actions Landshark instead of looking for someone to blame. If I am not mistaken isnt her name Beverly Remember the Old saying you can't be first but you can be next... Or did you just mean it was her first for the new Year? Or is it you not even married it is just a front for your gay lifestyle/

Bill I am sure you impressed the hell out of a bunch of CB Losers with that one.

146. Multi-band HF antennas

Newsgroup: rec.radio.cb
Date: 2002-01-01 22:32:08 UTC
From: Jerry Oxendine <joxendi@bellsouth.net>
Message-ID: <rQqY7.342607$er5.7884615@e3500-atl2.usenetserver.com>
Source record: 110382

Hey guys!

Since things have calmed down a bit (well, a little anyway!), I thought I'd post something about
a type of mobile HF antenna called the "screwdriver". It is primarily aimed at hams, but some of us that hang out in here are both, so I figured I'd tell something about the design for those
who haven't heard of it. The objective of this mobile antenna (they can be configured as base
antennas, too) is to allow for working a wide range of frequencies with low SWR and do so
while cruising down the highway. One doesn't have to get out and change whips, taps, or coils
in order to work from around 3.6 to 30 MHZ and even 6 meters in many cases. And it doesn't
involve tuners, snake oil, or other gimmicks often seen in CB shops to make people think an antenna can be highly efficient AND broad-banded all at the same time. Here's how it's done.

For the ones who have some radio "savvy", it is fact that the right way to tune an antenna is by
varying its length, adding or removing coil turns, etc. and other means that change the resonance
of the antenna. And let's not get into that coax length thingy for Heaven's sake! The screw-driver design uses a cordless screwdriver inside a 2" or larger lower mast to move a loading
coil up or down as needed to resonate the antenna to precise frequency. Usually, there are
brass or copper "fingers" at the top of the mast that surround the coil as it exits the top of the
mast to provide electrical integrity (contact). One installs a 6-pole, double-throw, center off
(spring loaded) switch at the operators' position. When this switch is activated, the motor pushes the coil up (or retracts it) exposing more or less turns of loading coil to the air--those
that aren't in use are down inside the mast and, in effect, are part of the mast. One can accur-
ately resonate the antenna to 1.4 or less while tooling down the ole interstate. To do so, dial
up the desired frequency on your set, reduce your power to very low (to protect finals during
the mismatch portion of tuning), and run the antenna until the SWR is at minimum. Set the rig
to the correct mode and power and start talking! No matter where you go in the HF spectrum,

your antenna will always match! Many ham/'CB truckers are using this neat antenna to give them flexibility no other antenna can give. They make HF mobiling easy and FUN!

I build a version of this antenna called the Carolina Cyclone I (actually 2).The lower masts
are of 2 1/4" aluminum. Coils are of UNMW (black Nylon) for rugged, long-lasting service.
Wire is heavy duty #14 tinned copper on a full 2" grooved coil form. They are warranted for
one full year, will handle power of 800 watts, and have a pleasing profile. Every part is extra
heavily built and will give long service. The price for these antennas (that I have sold for 7 years) is $240 shipped to the lower 48 states. If you are a ham AND a CBer, you will LOVE
being able to operate ham and CB with just ONE antenna (2 radios, of course, we know THAT!).

There is a 3" version, called Cyclone II, that is built to the same rugged specs, but gives the maximum in Q. Parts are the same, but larger, for that ham/CBer who wants the absolute MOST he can derive from a multi-band antenna*. This extremely efficient and effective antenna system is $350 shipped to the lower 48 states. Compare on the web with the well-known makers.

I need to sell about 3-4 antennas this month. This time of year is slow, so the shop only has
2 orders right now. Contact me and let me show you what I have to offer. Pics available.

73

Jerry

*NOTE: If you are operating CB only, this antenna will NOT necessarily increase your signal
over that of one of the Wilsons, Predators, etc. What this antenna does is allow one to operate
loudly and effectively over a wide range of frequencies. They DO have VERY good signals, and, properly set up, are hard to beat. There are even products on the market to automatically
set the antenna when you change bands! But I do not sell "magic", or try to make people believe that somehow MY product just beats everything out there. Much stuff you see at truck
stops and that "coax length" stuff IS snake oil, and you must be careful.

Thank you Torbjmorka or Torb or whatever your name is. Please be aware
there is a guy forging me so *don't believe anything he writes*. He is
a bad troublemaker man and he says he is Scott (but he is not). I am
the real true Scott and the only way to tell my header from the forger
is to look for "uppluss@hotmail.com". 73 and 88 and qrt on the side
and good dx.

Scott

153. Hey Torbj

Newsgroup: rec.radio.cb

Source record: 110390

PS Torb, if you don't believe I am the real Scott ask yourself would a real CBer be complaining and trying to enforce ISP rules.....or would he be telling you about how to do illegal stuff with the FT817 (like I am)? 73 and good dx.

Scott

I have seen some of these at hamfests as well as on the road and thought
they were kinda cool, even if they are kinda strange looking. Once I get my
ticket and get my gear setup in my vehicle I might look into one of those.

Jerry, I assume you have also seen the dipole, 2 element, and 3 element beams with the stepper motors in them. They literally change the size of the antenna as you change frequencies and run from 13 MHz to 30 MHz! They also can reverse direction (180 degree switch) in a couple of seconds by changing the length of the director and reflector (effectively making the director the reflector and vice-versa). The swr remains close to 1 to 1 at all times, since the antenna size gets adjusted to true resonance. Now, if they could only extend the coverage to 160 meters ....
;-)

Source record: 110449

Why Thank You very much Landshark .
You are correct Sir, the normal radar can be "jammed"
they have a rfi circuit built in and the presence of rf near them will trip
the rfi circuit and hence no readings. A transmitting cell phone placed near
certain radar can do this, a barefoot cb radio has also done the same thing
in a test vehicle. There are also many other jammers sold on the market that
do work on the test bench but I have yet to see one work in the field.
Traffic radar bounce microwave radiation off of moving vehicles and detect
the reflected waves. These waves are shifted in frequency by the Doppler
effect, and the beat frequency between the directed and reflected waves
provides a measure of the vehicle speed.
When a police radar shoots out a pulse, it echoes off of all sorts of
objects - fences, bridges, mountains, etc. The easiest way to remove all of
this sort of clutter is to filter it out by recognizing that it is not
doppler shifted. A police radar looks only for doppler-shifted signals, and
because the radar beam is tightly focused it usually only hits one car.

For a jammer to work it would have to overpower the signal that is reflect
off of your car and direct it at the radar as well. Most jammers that I have
seen put out white noise which just blanks the radar as I said on the test
bench but not on the highway.

ANYONE thinking the FCC IS, or is LIKELY to do anything with any serious degree of dedication and
aggressiveness to "control" or in ANY way address the issue of CB lawlessness is living in a

DREAM WORLD!

The likes of Riley Hollingsworth are doing precious LITTLE in the direction of "CB crackdown" - and
about all you see at best, is perhaps one such FCC case per month - and THAT only occurs if the FCC
is taken by the hand and forcibly LED to the offender by a Ham or government/commercial interest who
has already done all the footwork FOR the FCC...

Get a ham license. Then you can (legally) run up to around a kilowatt
on thousands of channels.

Philp, an inexpensive device which should work is to put a piece of 2X4 BEHIND the gas pedal! The one I had read about used a tuned circuit and antenna; it simply was much more effective at returning the signal than the car. At that point, a diode and audio frequency could apply modulation to the signal. The audio frequency would be detected as doppler shift. Since it was stronger than the reflected signal from the car, the radar would interpret the modulated signal as the correct one. Problem is, if you set it for, say, 58 MPH so you don't get a ticket on the expressway (assuming the limit is 55 - it has been raised in most places in the country) and then FORGET to reset it, you could be in a real mess in the city or village with a 30 or 35 MPH limit. Suddenly, you do 40 and get a ticket for 58!

GREAT QUESTION! Can this antenna handle 10 KW? 20 KW? Ha ha...sorry,
just joking.

A better question is - can we use a screwdriver antenna to "screw"
legitimate users out of their frequencies?

Just kidding! Honestly. What we CBers really want to know is can
this antenna tune 10 METERS????

I am dead serious about this, I want to know too. The ham in the CB
newsgroup are always telling us not to try power on FRS. I think they
are jealous of what we have achieved on CB! Clipped limiters! Echo
mikes! VFOs to slide onto ham freqs! 60 KW mobiles! I bet we can do
the same or better with FRS given a bit of time.

Lay off Landshark will ya Shrimpie? Maybe this daughter is the first
hes having with a brand new wife. The reason we remember his daughter
being born last time was it sticks in people minds that he was
soliciting meetings with transex shemales in Northern Cal while the

last wife was preggers. Could be wife #1 found out and split. Hence
wife #2.

Oh god I am getting a rock hard woody thinking about that 10 KW driver, are you too SD? Just imagining what a big man on the CB I'd be if I had 10 KW gets me soooooo hot.

CBers aren't on 28 mhz. Your eyes are getting heavy. There is no 10
meter bootlegger problem. You are getting sleepy. Hams should mind
their own business. You are getting very sleepy. There are no
truckers on 28.085. You are in a deep deep sleep.....

27.555 is a govmt freq so maybe you could get the govmt users to
complain. They are more "respectable" so the FCC might listen to them.

>Why Yes silly you, what on earth would posses you
>to take time and do a google search to see if I have
>mentioned I had a daughter?

I remembered from your previous posts, just like you
thought Dick would have remembered (or so you say).

BTW, it's easy to find a specific post on google if you
can remember the right keywords, like 'daughter' and
'buell', and only search in rrcb. Not too many posts
have those params. I think I spent all of 15 seconds
retrieving it.

> I haven't mentioned you
>or said anything about you in months and all of a

>are protecting the forgers don't care.

Now that makes a whole lot of sense. Let's see, if the
forgers didn't care then they wouldn't be forging, would
they? And if someone else didn't care then they wouldn't
be protecting the forges, right? Is that some sort of
apathetic activism? Are you really the Professor in drag?

> I notice your back
>to using CET,

I commend your finely honed powers of observation.

>them.

It's down to about 15 - 20 spams a day, but thanks for
reminding me.

> I also see you want to by pass kill files, otherwise
>you wouldn't have changed your screen nic, to which also
>you have said you don't do.

Gee, how did you figure out it was me? Duh...

> Frank, one of your personalites
>are breaking your rules.
>
>
> Landshark
>
>
>PS. This little alias has also been added to file &
>Kill File.

That's ok, I can get past it anytime I want. But it's
more fun knowing you won't read what I write about you.

But here's the good part. You admit that if Dick didn't
remember you had a daughter then it appears that your
post looks like you are saying this is your first kid.
So I called you on your 'assumption' and pointed it out
to Dick. And then you start in complaining about me
assuming that you are lying! Do you ever step back and
read your own BS from an objective POV, sharkie?

You don't have to. That's why the law here allows deadly force if the
shooter reasonably believes that "the land or property cannot be
protected or recovered by any other means."

Penal Code 9.42
(B) to prevent the other who is fleeing immediately after
committing burglary, robbery, aggravated robbery, or theft during the
nighttime from escaping with the property; and

If they're getting away with your property, and you reasonably
believe you won't be getting it back unless you stop them now.

Depends on the situation, and having a cousin trying to make a name
for herself in civil law can cut the costs a *lot*.

Make it even a little easier by keeping an extra gun in the car, so
you can tell the cops that he had access to a gun after he broke into
the car.

Good show, the winds are beneath your wings.
>
>
If you have or have access to a half-decent HF reciever you might
consider copying "real cw" code practice off the airwaves. The ARRL
station w1aw broadcasts code practice sessions nightly and it's a
helluva lot of fun. Plus it would give you experience with real radio
operations. The Internet is fine but it ain't the real thing, if you
can copy 7.5wpm solid off the air you'll kick the crap outta the VE
code test grinning from ear-to-ear.

Sorry to say Brian,
You got hooked by our resident forging troll.
The real Scott Unit 69 goes by Upplus@Hotmail.com
Not this one with the extra "S".
Please note that you can complain about this
to hotmail, here is an e-mail I received yesterday
concerning these posts:

Hello S3Buell,

Thank you for writing to MSN Hotmail.

I have checked the account that you have reported and found out that it has
been forged. The individual is forging a Hotmail address suggesting that
the message is associated with Hotmail.

We have actively pursued legal action against many of these spammers who
are forging addresses using the Hotmail domain and would like to thank you
for taking the time to forward the message you received to our Abuse Team.
Should you receive any other unsolicited e-mail with the Hotmail domain name
in either the header information or the body of the message, please forward
it to abuse@hotmail.com so that we can investigate each instance.

We encourage you to visit the following links to learn more about spam,
forged message headers, and how to complain about e-mail abuse.

The Anti-Spam HOWTO:
http://www.cauce.org
http://www.bluemarble.net/~scotty/forgery.html

So if this does bother you, you can do what is
described above, if not , life goes on.

Boy, now all the alias come
out of the wood work, boy George,
you really ought to calm down, the
New Year has just begun.
Yup, it sure seems to bother
him, more than anyone else. 13
post on just an error of saying wanting
the first baby (of the year) But George
and Sparky just want to whine about
something. George wants my attention
again by changing his screen nic, like
Sparky, boy they sure are the consistent
trolls.

From: uppluss@hotmail.com
Message-ID: <a2cf6f35.0201011945.2610f1d3@posting.google.com>
Source record: 110494

I know it sounds strange but I was doing some research on their posts and all these guys share the same opinions about stuff. For instance all of them...

-support illegal CB
-sell/buy/service/amps
-hate the FCC and hams
-think they own the NG

What's more they are all capable of acting like idiots and forging people and posting threats and stuff. I am really beginning to wonder about this NG. I thought I had a lot of friends who shared my views (above) but now I think there is but a single person pretending to be all of them!

207. Buying Amp To Increase Penis Size

Newsgroup: rec.radio.cb
Date: 2002-01-02 03:48:53 UTC
From: uppluss@hotmail.com
Message-ID: <a2cf6f35.0201011948.1e90547@posting.google.com>
Source record: 110495

Maybe you guys can answer a question for me. If I buy a big amp (yah I know it's illegal but I don't care) will it make my penis feel bigger? As it is my weenie is rather small and when the big boys get on the channel I lack confidence to talk with them unless I am running power. I am of the opinion that a amp might do the trick for me. What do you guys think?

Hey Dave or Debby if someone (let's say, oh, Landshark for
example)were to "lie down with men" as if they were women would this
be a sin? Let me spell it out for you, I'm talking about she-males and
hooking up with them by hanging around in transsex newsgroups.

There is a lot of talk about Landshark doing that stuff and just in
case it is true I want to know if he is going to hell or not. Is he?
Just for being gay? If so, maybe the ISP enforcement work and net
policeing he is doing now will make up for it.

Will God take that into consideration when he is judging Landshark? I
hope so.

Well, there is one man in the world that will thank him all over the place, my friend and inventor of Bozo*Flush, the one and only Mad Boris. By the time we put in the stuff to flush these doofs, B*F will be bullet proof. Hell, Gil Bates might even buy/steal it.

One of the suggestions I have pending is to pull out things with cross-posts on them. Might allow two groups but more than that sends the whole thread to perdition. At least the twits might have to work a bit harder to start a tussle.

Might you remember an old Beatles tune, Eleanor Rigby? All the lonely people, where do they all come from? Seems appropriate.

Dick NBK

What if Twistedhed and Landshark went to breakfast together and you had a chance to go with them? What kind of questions would you ask them if say, you could only ask them 3 questions each? Mine would be:

Twistedhed

1. The jock strap trophy, can I see it?
2. What did the saucer men say to you?
3. Are you really a fake journalist?

Landshark

1. How many she-males you been with (if it's true)?
2. Does your wife know what you do with other men (if it's true)?
3. Did Bill Orr know you were a CB bootlegger?

Here's a good example of what I am confused about lately. SDJones
posts threats and antisocial stuff like this and nobody among the
regulars complains. That must mean we like it. I guess we do. That
would make us hypocrites when we complain about Doug posting foul
language. I guess we ARE hypocrites. Damn. You learn something new
every damn day. (Did I swear? Ooops. I hope Landshark doesn't get me
TOSed! No, come to think of it he won't. He'll give me a free pass cuz
I am part of the gang. Excellent!)

Whatever you find fun but I sure don't grok it. But that is not an uncommon state of affairs around Never-Never Land, is it?

That law gets you off the hook for criminal charges but does
not protect you from a civil lawsuit where you have the burden
of proving your innocence.

> protected or recovered by any other means."

Here's a quote from "The Texas Gun Owner's Guide" by Korwin & Lockwood.

"Some experts feel that use of deadly force in a property crime, which doesn't involve a threat to life or limb, would be difficult or even impossible to defend in court. Shooting an escaping thief in the back creates a risky legal defense. Many of the precedent-setting cases are old and may not reflect the current state of jurisprudence. Some Supreme Court decisions suggest that the use of deadly force in property-only crimes, or to stop a criminal who is fleeing once the crime has ended, may not be justifiable. Civil liability is not necessarily removed by being cleared of criminal charges."

"These and other factors make reliance on this law quite risky and not recommended."

A while back I had beam, a PDL2, on the garage roof.
Yes, they do work very good, and with a legal radio too except for the
modulation being cranked up a little bit of course.

Beams are nice, but remember they are big too and subject to maintenance
because of wind and storm damage.

If all you want is the biggest signal on the block, try this: Make a
-really big- coil and cap, connect them in series and tune. Mount them

between a flagpole and a very deep ground. Then wait for a
thunderstorm.

Let's all send a message to the FCC to allow more power on CB.
Everyone point your beams at D.C., and at 9:00pm EST on Jan. 15 we'll
all key up at full power! If you don't have a beam, find a large
building or hill to reflect your signal. Does everyone have 27.025
(ch. 6 for the mudducks)?

That's a great idea, I read up on it. You can take a bunch of batteries and a Ford ignition coil and attach the hot lead to an antenna and presto. Just making and breaking the circuit will generate a lot of noise on all radios on all frequencies. Man that's really lockin down them channels with the ultimate kick ass noise toy! Problem is that there's no way of modulating it (or there isn't a way that CBers can easily do because it'd involve building from scratch instead of ordering from Copper) so you can yell "aaauuuuuiiiiddddiiiiooooooo" into it. See it ain't really fun unless you're jammin up the channels with your own voice in a fake southern accent and using phrases like "doncha know" and "we're gone" [even though you keep saying stuff]. So if someone could figure out for us how to make the spark transmitter use voice and THEN be transmitting on all frequencies at once that would be WAY cool and just the thing for (I like the terms) Freeloaders, Power pigs, an' Piracy (which is what CB is all about).

Blowing FETs when attached to outside antennas (and amps that do not have a two-relay anti-blowback feature) is fairly common but mostly on shortwave receivers. Actually, having the FET in there is a plus -- avoids the ricebox front-end effect common with bipolars.

The fix is a 10k or so resistor across the antenna leads but beyond the antenna switching so it don't get transmitter power. Your antenna must not be at DC ground or the static build-up is fearsome where you live tonite.

Oh here is another thing that is confusing to me about freeloaders and skipshooters or whatever it is we do on the illegal channels. How come we say "we'll be QRT" and "we be gone" and "back quiet"...AND THEN WE KEEP MAKING TRANSMISSIONS? It doesn't make any freeking sense. It's like a guy saying 'well goodbye now and see ya later' but then never leaving the room.

Scott

Hi Dick I have an idea that might solve a lot of problems in the NG.
Why not get the BozoFlush to recognize discussion of legal CB and have
it screen that out? Then us illegals never have to see any mention of
um, federal laws or criminality and lame stuff like that. Put Boris
on it right away.

Yep that exactly what its doing, it work for acouple seconds at turn on till buildup......then receive cuts off.
Leave antenna off and its fine.
A 10 ohm resistor across the antenna work but that lossy and grounds transmit tank.
Perhaps I should try a 10 MH choke
I suspect something leaking into cutoff of buildup

Thanks !

Yea!
The answer to your question is NO you cannot modulate it!
If you could it would no longer be a spark gap transmitter. I don't know
how much power you think you could get out of one but 20W
is allot for a spark gap. It uses allot of power.
Besides you'll probably electrocute yourself before you ever get it built!
Plus it won't take long for the authorities to find you.
You'll be on everyones radio and TV so finding you will be easy!
I don't think anyone will be amused.

zap the original forged posting.

Zoom, you might be surprised at some of the ways AM was done by purely mechanical means in the 1910-1920 period. And some of them did indeed use a spark gap.

Sure it's illegal, what about a keydown isn't?

Sure it's Rube Goldberg on a grand scale, what about a 32+ 'pill' isn't?

Sure it is grandly inefficient, and losing a few kw in the alternator rectifiers and sheer IR drop isn't?

The idea tickles my sense of surrealism like floppy watches and naked guys in a tree at a funeral. Don't just imagine it, BE IT.

Spark gap transmitters were not all of the Ford coil variety. In the days when big tubes and filter caps were non-existent some mechanical transmitters were used, some using spark gaps and some not, a good number of which were damned ingenious. Filter caps were so dear that a lot of amateur transmitters used raw AC well into the 30s, hence the T of the RST system.

Hey man, this is Never-Never land where no one grows up. Why not?

Thank you! It was entertaining as all get out, particularly the sports scores.

Prof, you gotta gawk at these, they manage to turn out a 20% modulated signal. You're a piker next to this bunch.

When the government wants to make an example out of you, your constitutional rights mean nothing, but don't expect any commie atty. from the ACLU to run to your rescue.

Mitnik is like a number of others who were even more quietly thrown in prison for being just a little too scary and too smart for the feds. Ever read about the man who came up with a workable plan to do away with evil politicians via anonymous funding from the net? Guess where he is today. I certainly don't support his ideas, but I do support his right to print, post, or say anything per the First Amendment right to freedom of speech. But, he is a bit too smart, thus dangerous, and so he must be punished for thinking outside the box.

Of course you can AM a spark gap. Run the frequency up past audio,
modulate the current, and keep your fingers away from the electrodes.

Yeah, 10 ohms can provide a big loss. Dick suggested a 10K ohm, which
would work better.

>Perhaps I should try a 10 MH choke

That would work, too. Watch the power rating though, some of those
light-duty chokes will blow with very little power applied.

>how much power you think you could get out of one but 20W
>is allot for a spark gap. It uses allot of power.

20W maybe right off the spark, but hook that puppy up to a chain-link
fence and you could probably get 20 watts on just about cover HF.
Hell, who needs to change freqs?

>Besides you'll probably electrocute yourself before you ever get it built!

How do you know?

>Plus it won't take long for the authorities to find you.
>You'll be on everyones radio and TV so finding you will be easy!

So? All you are doing is building a Tesla coil, or working on a
science project for the County Fair. The worst they will do is tell
you to stop. Big deal.

I checked it out and all you have is cheap amps and expensive radios.
Don't you have any microphones? SWR/field-strength meters? Log books?
How about antennas? Coax? Audio processors? Your post said "radio
equipment", so where is all this equipment?

283. Re: Radar Jammer

Newsgroup: rec.radio.cb
Date: 2002-01-02 14:00:33 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <3C331281.525E62D@qnet.com>
Source record: 110621

Hello Derek:

Depth Finders or Automatic Door openers will NOT work!

The problem is, that there are too many different type Radar Guns out there being used. Using the wrong jamming technique may even increase the range of a existing radar gun, and register a higher MPH reading. And the amount of system variables that a radar jammer must handle, are significant, ya now need a computer.

I suspect that that the engineers and technicians that design and build the Radar Detectors, also design and build the Radar Jammers. If truck drivers analysed radar detectors and jammers for a living I would listen to them, but they don't. Be advised.

In driving defense you can use the best Radar Detector out there. Here's something that many people over look, as a defense mechanism against Traffic Cop Radar (TCR):

1- The Radar signal coming from radar gun, travels in a collimated (concentrated parallel lines of force, such as a pointed and focused flash light beam of light) way, and is very easy to detect. This is good for us driving guys, with radar detectors.

2- The transmitted radar signal from the radar gun must reflect off the vehicle, and return to the radar gun. The radar signal returning from the vehicle is at times very hard to see, due to a significant loss in the returning radar signal level, caused by the signal reflecting off different parts of the vehicle, return path loss, false returns, and a bunch of other things.

3- Because the returning radar signal is much harder to see, as compared to detecting the beautiful and very easy to detect, single path signal from the radar gun, this gives the driver with a radar detector a great advantage.

Meaning that a hot new radar detector can be used, if you understand that you can detect the radar gun signal, before the radar gun can see you is the key.

Be advised that this "I see you before you can see me" technique works most of the times but not all the times. Example: When traffic radar is used at a very short range, like when your hauling ass around a curve, and there is MR. Traffic Cop with his radar gun right on ya.

But most Police Officers I have spoke to (after getting out of the car) have said that there are just too many speeders to have to use any

special technique, to catch them.

But you can have a swang kit installed at the same time.

You know, now I know what swang is for: to get cheesy amps thru warranty
such as it is.

I had visions of a dye-pack on a Zener that colors everything a sickening
green if you get over 15 volts to void the warranty. Sixteen volts and
Boom, Pow, Fireworks.

Ain't quite to the level of Monty Python but that site and the whole
company is either into Surrealism or Magic Mushrooms. So are the
customers.

One other thing to keep in mind for driving defense. Keep an ear on the local trucking channel, and on the radar detector, after a little use you will get better at understanding to where the police are, or might be with their radar guns.

I have a special rag and bottle of cleaner I use everytime on the CB or Radar detector, after it saves me from talking with Smokey Baer!

Hello Erehwon:

These little cheap radios aren't worth any time or money to modify.

I have the FRS and GMRS frequencies programmed into my scanner. And I hear a lot of the hams using their modified 440 radios. They even use their ham call signs at times, pretty funny.

Dick, I'm glad to see the group hasn't lost it's sense of humor now that it is 2002! Actually, there was one spark transmitter (I wish I could recall the details) that gave a pretty clean signal and was used for an experimental AM transmitter. About that time tubes (or bottles, or valves, or whatever) started making the scene and rendered all of that experimentation moot. As far as the spark gap transmitter, I remember a couple (my best friends) back around 1978 had a problem with a neighbor (CB, 500 feet or more away) that was getting into their telephone, organ, and just about everything else. Considering the distance and the fact that I've seen and heard it before (and witnessed the QRM one time), I was certain he was running at least 100 watts. I suggested about 9 feet of bell wire fastened at one end to an insulated clothes line and the other to the spark plug of their mower. Not enough power to hurt anyone a mile away, but if he couldn't hear 'em he couldn't work 'em (and would go QRT). Fortunately, she and her husband didn't try it (we were pretty well into the 807s and her husband ended up 'dozing' on one couch and my eyeballs were going down in a chair. His wife said to mine 'this is going to be a 3 beer dinner. 3 beers more and we'll eat'. I am grateful that I've back way down on those hydraulic sandwiches though - new year's day and no hangover. Kinda nice.

Dick, ya got me thinking. You're right about the amps. Why distort audio rather than simply increase the carrier and keep the audio clean? Likely to protect sweep tube amps (or transistors with inadequate heat sinks). Just a guess, but I think you are on the money.

Most of these amps are JUNK. I noticed there was a amp with 64 PIlls or bigger that could be built. I dought he has a power supply big enougth to power some of these amps, much less a way to masure their real power output. There was one that he showed that needed over 800 AMPS to power I would like to see the cable needed to power that one up, and I dought that he doesn't even know on how to power it up even if it could be built of what kind of ontput connector or cable to use at that power, NOT A PL259. Sounds allot like a bunch of bull shit to me. I wish there was a good amp builder out there with good filtering, LPF, and a good Active bias on the finals. Most of these guys most likley do not understand the real RF world. Just copy cats from other JUNK AMPS.
Its bad that Most of the CBers beleave these guys.

Yes I agree there are a number of ways to mechanically modulate. The
problem I have with this post is that it mentions modulation of a spark gap
transmitter.
If your talking about the conventional sparkgap transmitter then NO.
If your talking about constructing say a large coil intermittently excited
by your voice then we are no longer talking about sparkgap.
It is possible to have a high voltage source connected to an electronic
switching arrangement that would excite the coil with large doses of energy
in step with your voice input.
A mechanical option is to use a vibrating reed that makes and breaks contact
with your voice. The trouble with this method is that it is not real
efficient since there is a possibility to loose much of the intelligence due
to electrical bounce of the reed contacts.
In the traditional sense this is not sparkgap.

I'm all for experimenting and encourage it but I am dead against anyone
knowingly causing undue interference to draw attention to themselves.
Any generation of signal of this type will cause large harmonics but with
filtering, these harmonics can be reduced to non interfering levels.
Main thing is to have fun without affecting other peoples rights and
freedoms.

I seem to recall something about a Marconi centennial event where they planned to duplicate his trans-Atlantic transmission using a spark-gap transmitter. That would have been on Dec. 12, 2001, but I haven't heard anything else about it.

Jim, the tendency of Class C amps to reduce the modulation level (we won't go near clarity) is probably a minor reason for swang. Prof's one lunger, even if it does not beat the living crap out of AM will turn a 100% modulated signal at four watts into an 80% modulated signal at 100. If you use Mongolian Modulation, who will notice? Some of those Noname boxes if you believe their specs won't pass audio at all and the usual modulation level is 20% on the big boxes given 100% to begin with. Just

enough for the judges to know who you are at the keydown.

And yes, if one is subjecting an inadequate device with an inadequate supporting cast to severe beatings it is nice to let your 'bottom' rest on rare and selected occasions; any good Master knows that. So we cut the carrier back between the whip-and-chain sessions.

A morning klatch discussion this morning was on the tendency of kids, women, and men with testosterone poisoning to listen to anyone but someone who knows -- perhaps because dreams get shattered that way. Who knows. Every doc in the world hears, 'But my girlfriend says ...'.

A dear lady late last nite announce she was 'QRT on 27.555' and being late and I was a bit groggy asked if that was a real QRT or a freeband one. Not the friendliest thing to do and I apologize all over the place. But this is a classic example of how mythology gets going.

More than likely someone who knew enough to be dangerous said QRZee, ignoring the convention in the English-speaking world to make it Zed, which was predictably understood as QRT. So now you have a bunch of wannabes going QRT on the side. No one does his homework, no one asks, the lemmings just goose-step to the nearest cliff. I am not a great fiend for procedures, in fact I like to irritate the anals which is an unwritten privlege of a 1x2 Extra, but it jars a bit when someone announces he is listening while shutting down his station. Listening to what, pray tell.

Welcome to Never-Never Land where nobody ever grows up.

Dick NBK

Hey guys,

Actually I think what's hurting this unit's sales prospect is the lack
of SSB. I personally would love to get my hands on the new Magnum
SSB-1010 h/t. It'll cover the entire 10-meter band @ 15 watts P.E.P.
and I can use it to listen in (Yep, you read right...LISTEN!) on
11-meters as well. When we go on our w/e trips to MD, Philadelphia,
the Poconos, Atlantic City, Mystic, etc., I'd love having this
capability. Add in a lightweight dipole and it's a pretty cool
package. Just my two cents. :-)

The music you have been hearing has been coming out of Phoenix Arizona for some time now . Some guys (Purple Turtle for one) over there try to jam the frequency . It's an illegal frequency so, anything goes really ! If you have been hearing it for the past 5 days, something tells me you have only been listening on 27.555 for the those past 5 days only, but that's no reason for the other guys who made replies to this to talk trash about ya . But, that's 11 meters and it's operators for ya !

It's like that other "eloquent" saying----"We're QRT and a-standin' by" (and
don't forget the
word 'there' which must punctuate almost every sentence like, "10-4 thar",
or "I know whutcha
mean thar", or "I heered that thar", and "We gona be clur [clear] thar".)
LOL!

Yup! Yup! Yup!!

I think ole KA4MUJ (sk) was right when he said these people had "a disease".
Can't get it out of their system. It's all they LIVE FOR which means we have much
more radio fun to look forward to. I still miss the Mike and Judy show however.
When Raincoat Charlie would get in there and talk about "4x D-Cell vibrators"
and such, it was like live comedy theater you'd pay $35.00 a seat for downtown
right out of your speaker for free. It can only get better in 2002. When NR5T and
EVE get in there it's a 3-ring RF circus. So all you SWL's get tune in to 14.313 USB
for some daytime and weekend radio fun.

I think what your actually after is an ARC Transmitter and not a spark gap transmitter. The difference is in order to transmit a AM modulated signal you need a carrier. The spark gap does not support that but an arc transmitter does and is fundamentally different. The carrier is generated in the arc LC combination which is continuously produced and coupled to a tuned LC circuit. The ARC is then modulated to produce AM. Very high voltages and power are required thus making this design not only dangerous but impractical by today's standards.

Why would someone spend 13,000 on a 20,000 RMS watt (40,000 peak) amp just to say Auuuuuuuuuuudiooooooo. and the amperage 2200 amps the powersupply itself is expensive and I could imagine deadly is it possible to get 2200 amps from home power?

anyhow with 13,000 you can do better like buying some nice radios (ICOMS,yaseu etc) and have plenty left over.

Troll. You suckered me once (as someone pointed out).
At the risk of being suckered again:
Anyway, if you know how to do this stuff, you can
study to pass the ham writtens. Clipped limiters are not
a feature with SSB or AM, but work fine for FM after
filtering. Echo mikes degrades intelligibility of your voice.

Speak for yourself!

First of all I doubt that any one has
> built an AMP with that power and managed to power it up.

I guess you could be this stupid. I have to hope you would know that an amp
this size wouldn't make much of an impression at a decent keydown. It would
get taken out in the first round of keys.

Of course
> some around this NG, would believe it. They are the ones with no teeth
> and a cig sticking out of their mouth.

I HAVE my teeth AND a cigarette hanging out of my mouth.

They are also the ones that
> might only know the word Auuuudddiiiiooooooo

ONLY when followed by..............T-T-T-T-T-T-T-TESSSSSSSSSST!

. Poor retarded things.

Back to you speaking for yourself!

Train

> Of course you can AM a spark gap. Run the frequency up past audio,
> modulate the current, and keep your fingers away from the electrodes.

Some of the later commercial, and military, spark gap transmitters used DC for the arc. The arc electrodes themselves were water cooled. The reason the DC arc worked is it has a "negative" resistance characteristic, i.e. the arc current drops with an increase in arc voltage. Not all of the arcs where done in free air by the way, some used a mixture of different gases etc. When the "negative" resistance of the arc gap in parallel with the tuned circuit of the output was greater than the circuit resistance you would get oscillations. The same idea applies to the simple circuits where the "negative" resistance characteristic of "tunnel diodes" are used to cancel the positive circuit resistance to get oscillations.

Hello Train: Yeah it obvious these boys don't make the keydowns.

I got all me teeth, and I am a good lookin guy. Just ask Welfare Claire
or Vegas Annie, or even Foxy Lady.

Pa beat us for smokin, (said he kept all the gasoline behind the barn,
and didn't want us smoking there) but never said anything about Beach
Nut or Whiskey. If ya moves the Beach Nut over a little ya can take a
few shooters.

How come we don't see these guys at the breaks or keydowns? More behind
the keyboard type of courage?

Jay in the Mojave

Dick, how many times have you heard 'QRZ the frequency, this is XXXXXX'? What they want to ask is if the frequency is in use, not 'who is calling me'. I'll admit, I just opened the handbook to try and find one of the most useless Q signals in existance. QSV? VVVVVVVVV

Then again, maybe I'll just QLF. The problem is that a lot of stations have to ZBM-2. Geeze, English works pretty well for phone contacts, doesn't it? Guess I'll have to ZBM-2 over on this end. Have a happy!

73 - er, make that best regards from Rochester, NY
Jim
ps - am thinking of asking for my old old old old call back under the vanity callsign - WN2CJV. Go ahead - anyone can laugh - meet me on the bottom end of 40. Meters or WPM, I am not particularly worried.

344. Skip & Jockstrap Report

Newsgroup: rec.radio.cb
Date: 2002-01-02 23:42:16 UTC
From: twistedhed_webtvnet@subdimension.com
Message-ID: <e9de0154.0201021542.13d391bd@posting.google.com>
Source record: 110683

"Back from the holidays and I see that dogie, nad and brother rat are still plying their trade under assumed aliases in the NG as a tribute to me and my kind. They never stop kneeling at my altar which goes to show I have a lot in common with an emperor or a king, CB-type that is. Lazy days on the bay, spectacular weather, drowsing in my recliner with a view of the crimson sunset, the sounds of triple five on the old Galaxy and dogie's jockstrap thumbtacked above the wheelhouse, a Colt 45 Malt Liquor in hand, that's my version of the American Dream, boys. Turn up the gain, Bagsticker and Pink Muffin are making it into the pile while Gin Ruby and The Louisana FeatherDuster coming through like gangbusters on 27.850. 11 meters has been open to all parts of the known world including Galveston Texas and my own best boy KP82 yelling like a stuck pig heh heh. Well you may or may not have ole Twisted to kick around any more as I may be accepting the Nobel Prize for Literature in Stockholm this year (my essay in Sporadic Waves was nominated. Take THAT nad! ha!) and I just may stay on there for a time. Depends on if I can pirate some on CB or if they got laws that get enforced, know what I mean? In the time being I hope some one can take my dogs out for a walk and discipline them if they howl too loudly"

Bwahahahaha,

He is an old friend, he resides at a group home that I used to manage. He is into the radio hobby, and he is a member of the local Red Cross disaster team, as well as a member of the local REACT team. He finally got his internet setup and wanted me to set up so he could keep in touch with the world, and his interests.

Keith

P.S. his name is Mr. Asshole hahahah no actually thats what I call him, his name is Curt.
So I hope everyone will welcome him to our little fold. Let him get used to everyone before the flame wars against him begin heheheh.

He said if anyone is mean to him he'll tell me (shrug) I kick his ass all the time heheheh. We used to go out drinking and shoot pool at the local biker bar, I've seen him fall down the stairs head first to the basement radio room on many occasions after leaving the bar. Then there was the time we drug him outside in the winter and shoved sbow down his pants and up his shirt just for the hell of it. He put up one hell of a fight. heheheh

Lanshark since when has beating the feds been something to be worried
about? You guys talk about it all the time like you are proud of it.
Freebanders beat the feds as thier hobby.

Well Mr., HAMburger, you got suckered by a forging troll again.

Not that this message does NOT say groups.google.com in the
organization, and that my IP address does NOT come back to AOL.

So now that you've seen a real message from me, you can stuff
that echo mike up your ham ticket. I have had enough ham snootiness
to last a lifetime, and at this point will never get a ham ticket
and I will persuade others to stay away. Remember, you are only one
ham, but if you are the first one that a non ham sees, you are what
the non ham expects from all other hams. Thanks for putting the ham
fraternity back into perspective for me.

It's only legit if you throw out the extra "S". That "S" stands for
"salt". We throw that away.

I'm as phoney as you are! Look a little closer at the message attributes. I sit back and laugh at the poor attempts to be me, with poor spelling, punctuation and other things that I didn't say. I watch the hambos take the bait. I just had to let that one hambo know his actions can cause others to have a poor view of amateur radio. I haven't posted much lately, I have too much fun gathering the evidence for Hotmail. I'm glad I'm not him...

From: wavelengthzero@aol.com
Message-ID: <8b6cfc98.0201021722.1b8dfc31@posting.google.com>
Source record: 110501

Why do people buy those 590 dollar Ranger 2995 dx base stations when you can buy a brand spanking new ICOM IC-78 and no screwdriver required? for the same price, and those icoms do 40watts RMS AM and 100 PEP sideband, you can program all 40 CB channels (even put the label on the screen with channel number etc) I use the SM-20 deskmike. anyhow the ICOM is much better quality than Korean junk and is rock solid on SSB (no drift,donald duck etc)

500,000 Watt Klystron CB amp Requires 20,000 amps to run this. uses the Eimac Power tubes and High Current Cables and RF shielding Cabinet with real ground required.(call your power company for a High tension circuit and transformer installed at your house if you plan on using this)

the AMP has 3 modes, AM,SSB,UWM

ultra wide mode will transit across 26.500-27.500 in one shot so you can get out on all the channels but ERP drops to 100,000 watts in the UWB mode

250,000 dollars (only 50 cents a watt)

Source record: 110505

Try using CB channels 1-40 during the day for convoy communications or other kinds of actual use. Worthless, between the 7 pounds of Noise caused by the idiots running thousands of watts to talk to themselves etc.. The freeband actually is the place to be, but Its getting worrysome some ass was tying up 27.555 with Music, anyhow anyone actually Use CB 1-40 for anything? how was the freeband when the solar cycle was down? was all DX dead??? anyhow this freeband is cool, with a little Icom radio I talk around the world using a 102inch whip.

Hey man don't be worried. What did we do when chs 1 thru 23 got
crowded? We MOVED ON UP. And what did we do when 23 thru 40 got all
messed up with idiots? We MOVED ON UP AGAIN. So what if the freeband
gets trashed with idiots? We just MOVE ON UP to escape the mess.
Truckers are leading the way....

I bought this thing at a keydown it's fleshy plastic and shaped like a
bullett but longer. It has batteries inside and when you turn the
switch on it buzzes. The guy I bought it from said that Landshark used
it to have a good time so I take it that it's some kind of amplifier
or something for CB. Help me because I want to learn and I need
guidance to understand it.

Scott

This may be off topic but I have to bring up that 27.555 has been
getting all jammed up with idiots lately and causing freebanders to be
worried. I am not however worried because there are PLENTY more
clearer frequencies above the freeband to move to.

I don't normally run linears. I run QRP on the amateur bands and
occasionally talk on CB with my Tram Titan II.
I'm not understanding what your saying. Perhaps if you rephrase what you
want to say I could respond.
I'm quite capable of talking about any technical issues you wish to discuss.
Especially when it comes to communication theory.

Anyone else getting this awful weather? I'm in NC and we are getting pounded with snow and
cold! It is 23 degrees F with moderate snow and several inches. Forecast for 6 to 10" by tomorrow. Not Buffalo, NY, but more of the stuff than I want. It is supposed to get into the
teens by the weekend with more yucky stuff on Sunday. Messes up my getting out and going!
I should thank the Lord that we don't get snows like NY, but I just don't much like it at all.
The kids are excited, but I just hate to sit around the house all day tomorrow while it snows.
Hehe! I just heard on the scanner that there was an SUV a-straddle a tree with the front end
up in the air! Most people are prudent drivers, but if you are on the road in the snow, stay away from the SUVs! They think they're immune to snow and can drive up a brick wall.
Uh er, actually one did, after all, just drive up a tree! LMAO! Just not the way he wanted to.

Your right there. All I have seen in the imports from Korea, has been poor filters in the SSB mode, bad PLL warble, mods needed to go wide band, poor audio response, poor design but learning as they go.

The Dude wrote:

I don't think so, zoomie. A spark gap is a natural full-spectrum
harmonic generator. All you need for a carrier is to spark and filter.
You can modulate with a carbon mic. It's simplicity in the extreme.

Chain link fence hell, Sparks. You get it running on Channel 6 and I will
build a Rotary Rhombic. You know, spin a rhombic so that it comes around
at least once in an audio cycle so no one can tell and we can claim 14db
in all directions. Then we can build a joint project, the
Overmodulation-Proof final using FETs; they can conduct in both directions
so they can produce the negative power that 150% modulation requires,
right?

Don't Dream It, BE IT.

Yup, the resident Chameleon stole it from Hans Brakob K&#65533;HB on rec.radio.amateur.policy. You probably heard Hansel, Lord High Keeper of the Troll Meter, bellowing all the way across the Cities and being a retired CPO, it is a fair bet he can bellow with the best.

After 18 years in Wisconsin I am slowly, but only slowly, coming to believe there is a sense of humor in Minnesota after all but they had me convinced in Paribault that it was dead. Pariboo your pretty pink tushie.

Much later
Dick N&#65533;BK

The idea is to get downright pre-cambrian with this beast. We're
talking leyden jars, carbon rods, and brass balls. This monster is
going to spew some ozone!

Any speculation on the impedance of a 3" spark? How hard would it be
to match it up to the chain-link fence?

Relax, zoom. The original idea was meant as sarcasm, but since then I
have been thinking about it (shame on me) and I think it could
actually be done, and done well.

The wire is easy to find when I know what I'm looking for, but I have
a 15# spool of #26 sitting on the shelf that's just begging for a
project like this. I also have some rods for carbon-arc lights. I can
build a variable inductor with some plywood and a couple brass hinges,
and Leyden jars are easy to make. Hell, this thing might just work!

Does anyone have some really cool electrodes?

That would make an interesting show: One guy falls from a tree trying
to hang an antenna, another cleans pickle jars, while the other two
are taking turns winding the coil/massaging hand cramps. You might be
able to spice it up by using a pedal-powered dynamo instead of a
battery -- that could be fun if the teams are made up of a bunch of
crotchety old hams...;-)

Negative power -- doesn't that require some sort of Zero-Point-Energy device? Maybe not, maybe the problem is that the receivers are not capable of detecting 150% modulation because all the dilitium crystals have been used by the saucer men.

Well, you can amplitude modulate a sparkgap by making it rotating.

But I suppose you mean voice. It could be done, but the resulting signal would sound pretty awful. But then, given that they radiate (as the old saw goes) "from DC to daylight", you don't have a quality signal with which to start.

Uh, Dick. This discussion has been held before. Look up the definition
of QRT. It says nothing about shutting down the station. There is no Q
signal in the standard set to indicate that you are going off the air.

Same for me, although the biggest reason I don't post more has more to do with getting tired of the illegal banter, the ridiculous power claims, and the purveyors of "CB science". I figure if people would rather believe this smoke and mirrors theory, rather than sensible truth, I'm wasting my time trying.

For a good time, (at least us used to driving in snow and ice), try going to
texas when they get a freak snow or ice storm, bring along some classical

music and you'll have "idiots on ice". No offence to Texans, I have relatives there and have enjoyed my visits there, but I have seen how you all drive on slippery roads.

Hello Dave:

There's quit a few readers of this news group who really enjoy the technical conversations and such.

I on occasion I have received e-mail from people who just want to stay behind the lines and read the ng. As a matter of fact your name was mention to me, and someone asked what I thought about one of your postings. I looked up the posting that was in question, and I agreed with it. It was on some type of antenna if I remember right.

Point is, that any ng is like panning for gold, ya have to throw what you don't want. I think Doc said that, great analogy.

In CB and Ham radio you will always have the smoke and mirrors stuff.

The thing that has always gulled me is the guy looking at a antenna and says:
"Yeah that will load up just fine" while spilling a beer down the front of his shirt, on the previous beer stains.

Load up just fine!!??::

You mean load up in the back of my truck, or
Efficiently radiating the energy, or
Have a low SWR, or
Load up the neighbor hood with TVI, and open up all the garage doors, or
Load up the tower, or
Load down the rotor, or ......?!?!?!?!?!

Jay in the Great Mojave Desert, ... just down the road ah ways from the fillin station.

I could end up spending more money on one of those, including the cost to
retube it and fixing anything else screwed up, than getting a new rig with
the AM mode already built in.

> Granted you will probably have to get it out
> of an ex-CBer's garage and clean the mouse turds off of it but WTH

If an ex-CBer had it I'll bet it's beyond the point of even bothering to fix
in most cases.

i'm sure the icom sounds great on ssb but are you the best sounding around on AM? i doubt it. i've always found it best to have full band ssb gear for my day to day ssb use and just keep a little 40 channel around for ocassional am purposes. its easier on the listening station to hear me on the rinky dink when on am

>
>Why do people buy those 590 dollar Ranger 2995 dx base stations when
>you can buy a brand spanking new ICOM IC-78 and no screwdriver
>required? for the same price, and those icoms do 40watts RMS AM and
>100 PEP sideband, you can program all 40 CB channels (even put the
>label on the screen with channel number etc) I use the SM-20 deskmike.
>anyhow the ICOM is much better quality than Korean junk and is rock

let them say it wrong for a few years and all of the sudden it becomes the accepted standard. its odd how things like that work.

in answer to the first question.....yes i do believe everything that
noname tells me. and you are right i have no teeth in my head......i
am ugly as homemade sin, i have a big wart on the end of my nose and
yes i do live in a trailer on the northside...satisfied???

in answer to your second question.....no i have never ever, ever used
a amp in my whole military career......is that a copy????

in answer to the third question......yes i do know everything...i am
mr jones, down in jonestown.....come on down son and let me serve you
up some of my special coolaid.

in answer to your fourth question.....a hambo is.......well i rather
not go into that right now, if that is ok....???

in answer to your fifth question.....yes i am a negro male trying to
make my way in this cold white man's world........and i still say they
are a bunch of devils ....hello , come in.....

in response to your final comment.......son , it would be without a
doubt the best piece of virgin ass you have ever gotten.......and
dat's a fact jack........

and finally you are also correctamundo about me....i, mr weenie dog,
am just a big 'goff' off.................

What kind of a person craves attention so desperately that they would
spend thousands on such a device? Seems the money would be better
spent on a phychiatrist.

Hey you have that syndrome everywhere; things project personality, worth, and coolth. We have our rule-or-ruin frustrated ChannelMaster.

More for something to do than the money, I drive for a local bus service. We did a shuttle for a 2nd tier golf tournament this summer at one of these golf course cum houses made of ticky-tacky developments. It was absolutely hilarious to watch one group of yuppies tow out the vehicles of another group of yuppies who thought no one would tow their Lincoln Mortifier which the salesman said was immune from parking rules anyway. One wandering Iowegian parked his heap under the No Parking sign and the bahs were really reluctant to yank it: anyone driving a heap might really BE important.

Some how the Math does not addup.

70,000 Watts Power out equals to about 108,000 Watts input to the
final tube or tubes. Now tell me how that is generated in a mobile ,
that is 12 vdc at 9000 amps, or 120 volts at 900 amps, or 1200 volts
at 90 amps. Not using a 454 engine BS, Maby a Locomotive train could.

Well, in grade school I learned how to read and write. I did that so I could differentiate between two words that are not alike, such as "Ranger" and "Valiant". I also learned how to spell my name, and that was quite an 'experence'. Later, I spent quite a large sum on higher education, but I could afford it because I learned how to spend my money wisely. And because I stayed in school I learned how to communicate without the need to scream. Currently I am looking into building my own shortwave broadcast station. And because I have some education as well as some 'experence', I can put it to practical, profitable and legal use. It can also provide me with a venue through which I can communicate -- and I don't even need to key over anybody else in the process. I can afford it because I haven't wasted my money on junk.

So now tell me, Jay, what kind of a person would spend thousands of dollars for an illegal, multi-kilowatt amp that is built for the sole purpose of disrupting communications?

You don't give enough info are you talking about talking skip, local
talking, competition?
If you want to talk local 14-16 volts, a skip talker 16-18 volts max,
competition 10 second keys 20-21 volts max all should have a flat swr for
life expectancy. the reason being heat is what will kill the pill. they
rate it at 18 volts max. The guys who spend the time to tune there antennas
for a low swr will be able to talk longer.

Which means that the only people you can talk with are those similarly equipped. And if there is someone similarly-equipped who does not really want to talk with you, neither one of you talks to anyone.

Regardless of the original motivation, Sparky's recommendation for profession head-shrinking would seem to stand.

Hey Tim, I am Scott not Doug. I read back in the archives, and guess
what??? You guys started this whole forge thing by forging Doug/N8.
You even made up a web page acccusing him of being a child molester.
Some people would say that now you are only reaping what you sowed.

And most of them are in those Gosh-awful SUVs. They think their 4 WD can do anything., so they speed along, sliding into ditches, spinning around and taking others with them.

How we ALL drive on ice? No offense or argument meant, I do have a TV ya know, and I
see people all over the country slipping and sliding, and going into the ditch. I got news for
anybody that "thinks" they are "experts" on driving on ice. Even with chains, ice is dangerous
and you takes yer chances by getting on it. Contrary to popular belief, especially in the north,
NC CAN get VERY cold. We have THE highest peak east of the Mississippi River (Mt. Mitchell), and those mountains have snows of up to 20 FEET, not inches. People have been
stranded on the Appalachain Trail by such storms, and a group from Michigan was helicoptered out after the storm lessened enough. In the Piedmont, where I am, we get snows
of near 12' to 2 feet, but we don't get those often. I was born in Arkansas where the plains
blizzards are brutal. I've seen temps here at -10 with wind chills of -30. And that HURTS!
LOL!

Prudent people know that snow driving can be accomplished with a little common sense and
slower driving. Front wheel drive does a lot for cars in snow IF the driver drives carefully.
I always say if I have to be out in the stuff, 1) Stay away from cars with Florida tags; he might be a snow bird, but he also might be a native of the Keys who has never seen snow. 2) Avoid
teenagers in jacked up 4WD trucks. Their lack of regard, inexperience, and sense of invincibi-
lity translates to a dangerous wreck waiting to happen. 3) Actually, keep your distance from ANY cars; don't tailgate and discourage cars from tailgating you. 4) Allow plenty of braking
time, and be slowed down before you reach an intersection or turn. 5). Plan your route so as
to avoid steep hills; even if YOU can get up it, there may be cars stalled there so that you can't
get by. 6) If you do come upon a hill that is blocked with stuck cars, stop at the BOTTOM of
the hill and wait for a path wide enough for you to safely negotiate; don't go up the hill only to
have to stop and become stuck yourself--better yet, find another route. 7)

Take note of "yankee" license tags; these are sometimes overconfident New Yorkers, etc. anxious to show
"those stupid southerners" how much they know about driving in snow! LOL! Finally, the thing
that scares me the most: The persons that utters this famous quote, "It's not me I worry about,
it's the 'other guy' I'm afraid of". LOL!

Idiots abound everywhere, and I see vehicles on TV from every state sliding into ditches, spin-
ning around and it's all because of one thing. Disregard for common sense techniques for negotiating slippery roads. If we would employ the same methods we would use in rain (well
some would), there would be less wrecks. But Noooooooooo! We just gotta go at neck-breaking speed only to find ourselves off the road, injured, and ruining a $30,000 vehicle.

Hehe! I'm finished preachin' LOL!

Best 73

Jerry

John,
The recomended voltage is 12 volts. Will it work at
24 or 28 volts? No. The higher the voltage (over 12v),
the shorter the expected 'life' of the transistor. If you
want more power use a different transistor, or more of the
same. Over-volting is stupid.
'Doc

And an admirable job it was, too.

There are some drivers who can put it on a lawn or the median in July if there is a kid within two blocks with a snow cone.

I was in a procession in StL many years ago where it was necessary to go thru the boonies to the next freeway entrance. A guy with a jacked up 4wd Ford felt called upon to pass everyone, hit the icy bridge and put it in the grass on its side. When he climbed out the door, he received a purely spontaneous but rehearsed-appearing standing ovation from about 100 other drivers who opened doors, applauded, and got back in and slowly motored away. A truly Kodak moment.

Dick N&#65533;BK, a veteran of 18 years in Central Wisconsin.

When I was going to college in Toledo, driving up I-75 in the winter, some fool decided to pass everyone like we were sitting still, as he passed me and then cut me off, I said to myself "I'll be laughing at your dumb ass within the next two miles". And sure enough roughly 1.5 miles up the road he was buried up to his windshield in a snow bank off the right side of the road, trying to flag someone down, needless to say everyone passing blew their horn in salute, and told him he was "number 1".

But there there was the fool who was driving on I-75 on good road conditions, in a construction zone, who decided he was too good to be in single lane traffic with the rest of us, so he pulled between 2 of thse orange barrels, and proceeded to drive through the construction area. Four miles up the road the front suspension of his car was completely ripped out from underneath his vehicle after putting the front of his car into a huge hole cut into the concrete where they were repairing an expansion joint. I stopped to make sure he was ok, and then the police showed up. I explained what I had seen the fool do, and the officer who measured the skid marks estimated that this person with delusions of grandeur was driving around 80 MPH when he hit the brakes.

Gotta love these people who make life more fun.

Andy , we are just honest citizens trying to do a good deed. That is
all. If you
are doing something illegal, then you will be caught or reported. If
you are
straight about things, then you have nothing to worry about. I hope
that is
clear to you. We aren't here to cause problems but to offer our
assistance in
fcc matters. That is all.

The difference is that if the yoyo wasn't running the box about 100 people could easily talk to the guys with 1 watt if they also had the good sense to run 1 watt and a lot farther since the noise level would drop about 30 db. It's called reciprocity. If someone was really serious, he would use a beam, not so much to concentrate his signal as to be able to hear what he proposed to work. At the same time, he would limit interference to others. It is called sharing or at the very least not being a 'me-me' child.

>that is 12 vdc at 9000 amps, or 120 volts at 900 amps, or 1200 volts
>at 90 amps. Not using a 454 engine BS, Maby a Locomotive train could.

746 watts = 1hp, so 108,000 watts would need 145hp (at 100% conversion
efficiency). Still, that's nearly 8000 amps at 13.8VDC. Now knowing
800 amps through 10 feet of #2 copper will turn the engine compartment
into a toaster oven (1000 watts of dissipation) while droping 1.3V,

A. Multiple 3phase feeds, from each stator (the Electrodyne alternator of
choice is a single rotor, dual stator alternator, supplying nearly 600 amps
for each stator, peak).
B. Multiple alternators (on the average of 4 to 12 per vehicle)
C. NOS injected motors, big blocks or small blocks
D. Multiple drive pulleys, using 6 to 8 cog serpentine systems.

Again, you guys say it CAN'T happen, but yet we DO it. Why not get a clue,
check it out for yourself, and see that YES, YOU TOO CAN BE WRONG!

it
would follow that a device that needs 8000 amps is going to need
nothing smaller than 6" dia. solid Cu both ways,

Generally we use Heliax. Since one of the people involved in this
"sport" works for Andrews, it isn't hard for us to get the connectors
on the cheap, and surplus Heliax is available for pennies on the
dollar, if you know the right people.

and you still
wouldn't want to touch it.

I'm still wondering why>

Assuming an alternator exists that can
supply that much current,

See the above descriptions.
Also, CE Neihoff makes a 800A DC output (48 volt) system for the
Bradley military vehicle. The alternator is available for approx. 1K
dollars to the general public, but is much more problem prone than the
leece-neville and electrodynes.

it would necessarily be larger than the
engine.

NOT necessarily.

And allowing a very gracious 80% conversion efficiency (which
would require direct drive off the crankshaft),...

Not really, since we use multiple alternators, the load is split between
multiple pulleys,
and most all of the competition vehicles have custom billet crank pullies with
multiple 6 to 8
rib belts running on them.

So, yes, it is possible, yes it does happen, and yes you do need to pull your
head out of the sand.

Have a nice day.

746 watts = 1hp, so 108,000 watts would need 145hp (at 100% conversion efficiency). Still, that's nearly 8000 amps at 13.8VDC. Now knowing 800 amps through 10 feet of #2 copper will turn the engine compartment into a toaster oven (1000 watts of dissipation) while droping 1.3V, it would follow that a device that needs 8000 amps is going to need nothing smaller than 6" dia. solid Cu both ways, and you still wouldn't want to touch it. Assuming an alternator exists that can supply that much current, it would necessarily be larger than the engine. And allowing a very gracious 80% conversion efficiency (which would require direct drive off the crankshaft),...

Nope, it ain't gonna happen.

Scott, What the hell do you expect, your group of friends are plain old hypocrites. Of course it's not ok if someone else does it, just them. No one else can curse, or change monikers or they cry. Remember the keyclowns are like pack rats and stick together thru thick or thin, regardless of any rules, in fact breaking rules then crying to isp's are no different than the AKC complaining to the FCC. Yet Scott your bunch gets there panties all twisted, when someone mentions the fact. yet I have yet to see anyone get mad when they report someone to their ISP. Scott can you tell me Why this is in 1000 words or less? Why is it ok for your group of assholes to break rules and forge people but when the trick is turned you guys cry like little girls? Oh btw I realize In fact some of the guys are down right cool but thats no excuse. Scott I await your reply.

Doc, the max voltage they say to operate is 18 volts. Where did you arrive
at the magic 12v as the end all?

I have no doubt it has been tried and might on occasion be more or less successful but AC does not in fact change a whole lot. Spark's math holds up so well that were someone to do it, I would start looking for the hidden turbine running the alternator. If you are going to put 100 horsepower out of an antenna there is at least 500 hp in the system somewhere and you are not going to transmit 500 hp thru any belt system known to man. A leece is good for 3kw, 5 on a good day with AC running in Freon 10; all going AC accomplishes is eliminating rectifier loss and heat in the alternator. You can't get blood out of a turnip or run 24 alternators on a serpentine. Somehow if you get 10kw out of an alternator 3 seconds before the smoke cloud hits you still are running well over a dozen.

The amp is a trivial problem, powering it most certainly is not.

Sparky these types of wattage are being produced thru AC not DC. They use 3 phase AC alternators and step up transformers. Most of the engines are hi Horsepower with nitrous oxide. I don't believe some of the shit but I can believe what I said I have seen it myself. guy named No Pity ran a big davemade ac mobile down in Reading Pa. you have to see it to believe it.

"middlefinnger4",
If you'll read my post again, I didn't say that 12 volts
was the 'end all' for that transistor. I did say that for
voltages higher than 12 volts the 'life' of the transistor is
shortened. Where did I get the 12 volts? From Toshiba's spec
sheet and their recommendations. It just doesn't make sense
to run a 2SC2879 (or any transistor) 'full blast' all the time.

>that is 12 vdc at 9000 amps, or 120 volts at 900 amps, or 1200 volts
>at 90 amps. Not using a 454 engine BS, Maby a Locomotive train could.

746 watts = 1hp, so 108,000 watts would need 145hp (at 100% conversion
efficiency). Still, that's nearly 8000 amps at 13.8VDC. Now knowing
800 amps through 10 feet of #2 copper will turn the engine compartment
into a toaster oven (1000 watts of dissipation) while droping 1.3V,

A. Multiple 3phase feeds, from each stator (the Electrodyne alternator of
choice is a single rotor, dual stator alternator, supplying nearly 600 amps
for each stator, peak).
B. Multiple alternators (on the average of 4 to 12 per vehicle)
C. NOS injected motors, big blocks or small blocks
D. Multiple drive pulleys, using 6 to 8 cog serpentine systems.

Again, you guys say it CAN'T happen, but yet we DO it. Why not get a clue,
check it out for yourself, and see that YES, YOU TOO CAN BE WRONG!

it
would follow that a device that needs 8000 amps is going to need
nothing smaller than 6" dia. solid Cu both ways,

Generally we use Heliax. Since one of the people involved in this
"sport" works for Andrews, it isn't hard for us to get the connectors
on the cheap, and surplus Heliax is available for pennies on the
dollar, if you know the right people.

and you still
wouldn't want to touch it.

I'm still wondering why>

Assuming an alternator exists that can
supply that much current,

See the above descriptions.
Also, CE Neihoff makes a 800A DC output (48 volt) system for the
Bradley military vehicle. The alternator is available for approx. 1K
dollars to the general public, but is much more problem prone than the

leece-neville and electrodynes.

it would necessarily be larger than the
engine.

NOT necessarily.

And allowing a very gracious 80% conversion efficiency (which
would require direct drive off the crankshaft),...

Not really, since we use multiple alternators, the load is split between
multiple pulleys,
and most all of the competition vehicles have custom billet crank pullies with
multiple 6 to 8
rib belts running on them.

So, yes, it is possible, yes it does happen, and yes you do need to pull your
head out of the sand.

Have a nice day.

Well, this gets interesting. Formally, it means either 'shall I stop sending?' or 'stop sending'. Now think for a minute - if someone is 'sending', whether voice or digital mode, how do you tell him to stop sending? He has to stop sending for you to tell him to stop (assuming you aren't running full duplex). OK. Now, if you ask it as a question, you'll have to stop sending anyways to hear the reply to the question. The long and the short of it is this - generally (at least since I got into amateur radio in 1962) it is taken to mean 'shutting down the rig' or 'going off the air'. Usually this happens because the wife has dinner ready or you want to get some sleep; in this case you may say something like '73 om - WWV this is WWVA in Wheeling, West By God Virginia, qrt'. Ya leaves off the qrt if you're just gonna hang around (actually, I haven't heard QRT much of late - which means folks are beginning to understand and use plain English - an interesting concept indeed).

Bill, I am quite curious. How would one properly use qrt? I am not trying to restart some old thread (which I probably should be thankful for and will regret this question), but am curious how this could come up. I have only limited experience in nets, but the net control runs the show. After signing in, stations with traffic have precedence. The order is assigned by net control who runs the show. There would be no need to tell a station to stop sending since only the station designated by net control will be sending. The only way to get a station to stop in the middle would be to give him or her a land-line. I had one occasion which would have been an excellent opportunity for qrt. An SOS on 500 KHz was answered by several stations (including NPN on Guam, NPO in the Phillipeans, and a number of others). These guys were calling within probably 500 Hz of 500 KHz and it was just like a dx pileup. Unfortunately, being aboard ship, we couldn't compete with those 40 or 50 killowatt land based stations running rhombics (and the likely million plus watts of effective radiated power) who were even calling the station while he was sending his SOS! Please believe me, I am not trying to restart some old mess, but this one has me puzzled.

Thanks & 73 from Rochester, NY

With the Handheld Mike that came with ICOM, My AM was not strong since
the mike that comes with it is optimised for SSB Use. but with the
SM-20 ICOM desk mike I get very good AM reports and I have tested it
myself also. Very clear broadcast quality AM from the SM-20. with my
40 watts RMS and SM-20 I made AM contacts throughout the US and they
report nice clear audio. So AM is not a problem on my side either, and
the quality of the ICOM-78 and the SM-20 is real solid. I would never
go back to those korean imports, cheap build and bad
selectivity/stability. on the IC-78 when you put 27.555 you can be on
it monitoring all day and never have to hit the RIT button.

yeah this is worrysome, I mean the keydown idiots and drunks should
stay on channels 1-40, they already ruined the CB hobby on channels
1-40 I just hope the cancer does not spread to the outside frequencies
where you can actually talk to others.

OK I read more about it at
http://c2.com/~ward/morse/lecture.html

It says there you can make a spark transmitter with a neon sign
transformer. I might try it. The part I don't understand is why it is
illegal. If someone is hearing me on top of their communications isn't
it their fault? They are the ones with the weak radio if they can't
get over me.

I still dont understand the purpose of a keydown, other than spending thousands of dollars to step over someone else next to you who also spend thousands of dollars. Seems senseless spending all that money on some inane contest. with that money spent on amps you can set up some cool radios like those Icoms with the spectrum monitor and a nice beam antenna and rotator.

Doc, I have used these transistors at 14-15 volts with no fear or loss of power when will I start to see the power degrade? Like I said If you look at there spec sheet they list max ratings which is 18v collector to emitter. When you start running something near there breakdown point I can see a chance of failure being more premature. I don't think anyone said run it full blast either, but I see no where that toshiba akes any claims as to anything higher than 12 v will shorten there life unless thats just to be understood. is it like a tube? what wears out? Have you ever popped the top on one? Do they gradually lose power or just poof ?

>From: "Richard McCollum" rmccollOMA@worldnet.att.net

I have no doubt it has been tried and might on occasion be more or less successful but AC does not in fact change a whole lot. Spark's math holds up so well that were someone to do it, I would start looking for the hidden turbine running the alternator. If you are going to put 100 horsepower out of an antenna there is at least 500 hp in the system somewhere and you are not going to transmit 500 hp thru any belt system known to man. A leece is good for 3kw, 5 on a good day with AC running in Freon 10; all going AC accomplishes is eliminating rectifier loss and heat in the alternator. You can't get blood out of a turnip or run 24 alternators on a serpentine. Somehow if you get 10kw out of an alternator 3 seconds before the smoke cloud hits you still are running well over a dozen.

Well Dick, you seem like a guy with a lot of time on his hands. Why not drive your ass to NJ so I can give you a school lesson on how things are done. Yes 8 groove serpentines are used , oversized crank pulleys, nitrous oxide, over volted tubes. The fact remain a 250 amp AC leece is good for at least 10 kw, will it get hot you bet your damn ass it will, can you key it for long periods of time hell no. It takes me 3 alternators to get 15kw, 1-200amp ac alternator for the 3 tube 3-500z AC driver, 1- 240 amp Leece Neville for the 3cx3000 final amp and 1- 270 amp dc alternator to light the filament of both amps and to run the 3 pill driver, the radio and the mobile. rg 218 with a LC connectors, 2-0 welding cable, 4 to 1 ratio on the pulleys. 375 hp motor. Would you like to buy it?

528. (no subject)

Some how the Math does not addup.
>
>70,000 Watts Power out equals to about 108,000 Watts input
to the
>final tube or tubes. Now tell me how that is generated in a
mobile ,
>that is 12 vdc at 9000 amps, or 120 volts at 900 amps, or
1200 volts
>at 90 amps. Not using a 454 engine BS, Maby a Locomotive
train could.

Here is a reply from one of those guys talking abot the keydowns using
cars.>

you guys didnt believe? well here it is from tollholio
himself, a man with a
big steel tubed suburban.

746 watts = 1hp, so 108,000 watts would need 145hp (at 100%
conversion
efficiency). Still, that's nearly 8000 amps at 13.8VDC. Now
knowing
800 amps through 10 feet of #2 copper will turn the engine
compartment
into a toaster oven (1000 watts of dissipation) while
droping 1.3V,

A. Multiple 3phase feeds, from each stator (the Electrodyne
alternator of
choice is a single rotor, dual stator alternator, supplying
nearly 600 amps
for each stator, peak).
B. Multiple alternators (on the average of 4 to 12 per
vehicle)
C. NOS injected motors, big blocks or small blocks
D. Multiple drive pulleys, using 6 to 8 cog serpentine
systems.

Again, you guys say it CAN'T happen, but yet we DO it. Why
not get a clue,
check it out for yourself, and see that YES, YOU TOO CAN BE
WRONG!

it
would follow that a device that needs 8000 amps is going to
need

nothing smaller than 6" dia. solid Cu both ways,

Generally we use Heliax. Since one of the people involved
in this
"sport" works for Andrews, it isn't hard for us to get the
connectors
on the cheap, and surplus Heliax is available for pennies on
the
dollar, if you know the right people.

and you still
wouldn't want to touch it.

I'm still wondering why>

Assuming an alternator exists that can
supply that much current,

See the above descriptions.
Also, CE Neihoff makes a 800A DC output (48 volt) system for
the
Bradley military vehicle. The alternator is available for
approx. 1K
dollars to the general public, but is much more problem
prone than the
leece-neville and electrodynes.

it would necessarily be larger than the
engine.

NOT necessarily.

And allowing a very gracious 80% conversion efficiency
(which
would require direct drive off the crankshaft),...

Not really, since we use multiple alternators, the load is
split between
multiple pulleys,
and most all of the competition vehicles have custom billet
crank pullies with
multiple 6 to 8
rib belts running on them.

So, yes, it is possible, yes it does happen, and yes you do
need to pull your
head out of the sand.

Have a nice day.

There are plenty of vehicles out there that were purpose built......Just for radio and not much else! BTW, what would lead you to think that Kenwood's, Yaseus, Drakes (my favorite), and any number of other ham rigs have not or are not being used in VERY HI POWER setups?
I've run my 757GX on a 16 pill in the mobile and just as good a report on the other end as my Galaxy Saturn II or my TF Cobra 29!

Your mistake is that Electrodyne's are AC not DC. You assume the voltage to
be at 13.8 and this is not even close to the voltage being used!
Go back to the board and run the numbers again.

seen an ad in local paper
cobra 29nwst modified 26.000 to 30 mhz
100 watt adj output
also ha 40,+40 up ++40 up
freeband set up
$200
besides illegal (freeband) are all these mods doable in this rig????
not looking to buy it or any desire for it ,,,just wondering if this is
possible,I thought a 40 CB is just that in this cobra model
TIA fred

Source record: 110770

As a matter of fact, I have seen 'under the hood' of various transistors (before encapulization), which is completely beside the point. And actually they do act simular to a tube, except much faster. Since people don't 'operate' on that time scale, all that you do see is a puff of smoke (sometimes). 14-15 volts isn't exactly 'full blast', but it's getting close. I'd say that so far, you've been lucky. If ~you~ want to operate a transistor that way, it's your transistor, knock yourself out. I prefer more reliability and peace of mind. I've never 'blown' a motor by operating it below the 'red line', I have by running it ~at~ and above the 'red line'...
'Doc

No, the alternators are capable of 600 amps a piece, peak current output.

They will not last putting out that much for any extended period of time, but they are capable of doing so.

Been their, hooked the induction ammeter up to them, done that.

Toll_Free

>>>Train, I didn't assume nothing 300 amps is 300 amps thats what the spec on the alt say. does 300 amps dc mean 600 amps AC?? <<<

Well power is current times voltage. You can't add,
you have to multiply! 8->

Cancer is cancer. It's just not in such an advanced stage on the "freeband"
as it is where the cancer started. However, like all forms of cancer, if
left untreated it will spread throughout the entire "organism" with
terminal results...

I have enjoyed the radio communications and short wave listening hobbies for years. It's all about communication, meeting people, making friends, learning about other cultures, sharing information and ideas, and many times just plain bullshitting until the wee hours of the morning over trivial things such as the existance of life on other planets and UFO's.

Sure I have had people over to look at my shack, brag about my radio collection ect. I have also faced the problem many are today, that being the difficulty to talk to my friends because of all the noise on the band (11m) due to boys and their toys.

Now explain this to me? Why is it hams can communicate all over the world w/o bleding/splashing the bands? And at the same time why is it that people who run power and poorly modified equipment on 11m and the "freeband" can't talk w/o splashing all 40 channels, bleading everyone in town, and making life difficult for those of us who just want to simply ragchew with our friends?

It seems to me that all the power, and hacked radios are doing is perpetuating the problem. Sure you can give the excuse that you are using high dollar radio gear, moded yeasu, icom kenwood ect. and that your amps are "clean". But I will tell you this, those radios you have moded were not designed for these freq's, and no matter how hard you try, you will not get a clean signal off an amp and a hacked radio.

Whats the sense of having an overmodulated radio? A local guy who is one of those "golden screwdriver" types will peak someones cb for $15, it will do 125% modulation when he is done, sure it is "loud and proud" but, all that does is make it harder to understand. I like a nice clean crisp radio, none of that echo/reverb crap. It sounds "cool" for about 15 seconds, when the idiot that owns it starts talking too fast and his words all run together.

I heard someone state that they moved to the "freeband" to get away from the noise, to talk on a clean freq. Well if everyone would just stop polluting the airwaves with the power and hacked boxes, the normal 40 11m freq's would be just as clean.

I'll admit, I had said it before I was once guilty of running power, and having a hacked radio, but I have since learned to appreciate several things, first being a clean radio, second that while it is easy as hell to talk around the world with 1,000 watts, it is alot more exciting to get a DX contact with lower power, thats working DX. I have talked to other countries/continents on the standard AM SSB w/o power on a radio right out of the box, it was quite by accident, and thrilling as hell when the came back to me and told me where they were calling me from.

Flame away all you want, my turnout gear is flame retardant.

seen an ad in local paper
cobra 29nwst modified 26.000 to 30 mhz
100 watt adj output
also ha 40,+40 up ++40 up
freeband set up
$200
besides illegal (freeband) are all these mods doable in this rig????
not looking to buy it or any desire for it ,,,just wondering if this is
possible,I thought a 40 CB is just that in this cobra model
TIA fred

Unfortunately Fred, yes it can be done in a standard 40 ch cb, one of the most popular radios to mod, at least before the rangers, galaxy ect came out was the cobra 148 gtl, the uniden grant ect, their borads were designed so that you could add channels by jumping a few pins on the boards and adding a 3 position switch or reassigning a few of the switches already in the radio. I have seen some of these radios come through my place, from going to radio swaps, garage sales ect. many times the radios are hosed because some fool decided to tweak it and turned pods he shouldn't have or got a jumper crossed. If I am not mistaken the 29 uses/ or used the same board and chips as the 148, the board is manufactured by ranger I believe.

> buy it?
>

Admirable but there is a far cry between getting 15 kw and the 110kw as the example stated. I am far more familiar with the smaller Leeces and yours intrigues me. At 240 amps 15kw is give or take 60 volts which is also intriguing given that alternator fields are typically wound such that they pump no more than 16-17 or so to avoid blowing up every electrical device on the vehicle when the regulator pass transistor takes a dump. And the usual run of regulator transistor is not about to accept 60 volts across it. So presumably these are either special made or the whole unit is built for this sort of thing and you bolt the regulator lead to ground and derive field voltage from a small six pack and regulate it with a switch. OK, works I guess.

So you manage to get 15kw out of 1 so we can reasonably expect the 110 kw to take seven or eight plus the other two at least so now we are in the dozen bracket where I said we would be. And we are already on nitrous, my my. Overvolt the tubes all you like, last I heard E=IR and W=EI so es macht nichts to this discussion. And presumably the Gilmer belts (original name) are somewhere on the order of 3 inches or so (we are moving 50hp or so)
belt spacing is on the order of 4 so it takes a four-foot distribution shaft, maybe 3 feet if we chinz a tad. Now that is one remarkable foreshaft. Even your puny effort is probably give or take a foot and it beats the living daylites out of the engine crank.

You at least with dedicated alternators avoid another issue. At some point, at a small substation in the front or at the ends of a great mass of welding cables, the outputs of multiple alternators have to be brought together into the primaries of a 3-phase transformer to get the plate voltage if nothing else. You basically have two choices: find a way to sync eight alternators or build a separate DC plate supply for each one, combine them at DC and hope to hell there is enough balance to avoid a cascading failure. Conceivably I guess one could design the supply to only shell half of the system but small comfort.

No, I have no doubt that your 15 kw more or less works for a pretty restricted purpose but these 100kw monsters are largely urban legends. While one may on occasion work once (and likely be retired to stud or impressing the natives), it is wise to remember that you are only looking at the survivors. When the tourists gape at the cathedrals of Europe, no one ever tells them that the cathedral in question is one of 100 attempts and it fell down three times during construction killing half the town. It was, in fact, customary not to hold services for a year in them to avoid wiping out the town.

So it is with these things: like Haley's comet there might be one every few years but a guy armed with a Mastercard and a part's catalog is going to make in the vast majority of cases a major contribution to the machine shop and the junkyard.

Dick N&#65533;BK

Well the only way I can explain it is....

1. Breaking CB rules is OK because, well, because we want to. So what?

2. Breaking the NG rules is OK but only for me, Landshark, Train,
Twisty, Mopar, and the other cool guys (like Dick M. who is into
keydowns and illegal Cb stuff but puts on a false face when he's in
the ham NG)

3. Breaking the NG rules is not OK for anyone we don't like. We will
report them and act all outraged and try and get them TOSd. So what?

Basically we can break rules but no one else can unless we say so.
Hope that clears things up.

George try and see it from OUR point of view. Say Tim forged Leland
and had him asking to give blow jobs to VE's or selling amps or
whatever. That's funny and we should be allowed to do it. Whenever we
like, to whoever we like. But if someone forged Tim then that's not
funny anymore and we need to get them TOS'ed. Is that simple enough
for you to understand?

552. Re: 2SC2879 Max Voltage???

Newsgroup: rec.radio.cb
Date: 2002-01-04 03:48:00 UTC
From: littlejohn42@mailcity.com
Message-ID: <97169496.0201031948.9fd5573@posting.google.com>
Source record: 110789

Hi Doc,

Well, I'm really not all that concerned about getting more power. My reason for asking is in consideration of a power supply. At 13.8v, 8 2SC2879s will probably draw around 175 amps. That's a monster of a power supply to try and build. 90 or so amps at 28 volts is a little more manageable. I was aware of the 18v breakdown voltage claimed by Toshiba, but what caused some confusion was the claims of certain amp builders (like DaveMade) of running them at 20v or more (plus Japanese manufacturers are notoriously conservative in rating their products). I guess my question should be: What is the maximum voltage these devices can be run at without adversely affecting (shortening) their service life, or is there no level above 13.8V where these devices can safely operate? Although it is probably a mute point now since if it can only handle say a couple of volts over 13.8, it isn't going to make enough of a difference in current draw to bother with it. In any event, this amp will only be used for SSB and not in any mode operating at 100% duty cycle.

Thanks,
LJ

You're at fault if your generating strong harmonics on a wide spread. If a person's radio is tuned to say 4Mhz and you build a sparkgap or arc transmitter with an intended frequency of 2Mhz but because your signal is full of strong harmonics then the radio tuined at 4Mhz regardless of filtering and cost, will pick up that harmonic and receive your interference. It's great there are laws and standards that prevent anyone from building a transmitter that transmits anywhere they please. All equipment that emits RF energy must be tested to get approval. The exception is with homebrew amateur radio gear but this gear must be designed so it does not cause any undue interference.
You can read about this on the FCC site or many other sites on the web.

The only time you would not be at fault is if you are tranmitting on your intended frequency (leagally licensed to do so) and the harmonics created a so low as to not cause interference. The if a radio has a poor frontend and they pick up your strong CLEAN signal then it's the fault of the other persons poor receiver or TV or whatever.

My ICOM is not modded, its specs state 1.6 to 29.995 TX/RX. its a ICOM
IC-78
go to www.icomamerica.com and see.

I dont run power my shack only consists of 1 radio, my IC-78 to an
antenna tuner and a 102inch base whip. no Linear and I do not
overmodulate since I keep my ALC properly adjusted. and I enjoy DX via
11 meters. Infact I run less power than legal hams which seem to enjoy
using 1000 watt amps like the Quadra or Ameritron Power amps.

Why do I like 11 meters, the DX and the informal nature of the band,
plus no CW test required. of course channels 1-40 I dont use except at
night for local groups who chitchat on the legit channels.

Anyone use the SE Goldenrod 180s antenna?

It seems like a good antenna, how does it compare to other 1/2 wave designs in terms of DB gain and radiation patterns.

Is it better than the ABS Army Bigstick 5/8th antenna?

Hi LS not that I think you are lying but I think our ham critics would believe you better if you gave them the names of the FCC guy the DEA guy and the doctor. Since the sport of keydowns is all so out in the open you should be able to give their names without any worry. Hey maybe they could be interviewed in POPCOMM.

Rated at 300A continuous, the windings would need 0/2 or better (not
forgetting the load from the field winding). That's a mighty big
alternator.

>B. Multiple alternators (on the average of 4 to 12 per vehicle)

Now that's ridiculous. I doubt than a Suburban could even -carry-
twelve 300A alternators! (An "average" of 4 to 12? Did you skip school
that day?)

>C. NOS injected motors, big blocks or small blocks

NOS has two purposes: 1. Balloons; and 2. Cheap horsepower, both of
which fit right in with the big picture here. Do dentists still use
that stuff?

>D. Multiple drive pulleys, using 6 to 8 cog serpentine systems.

Ouch! Do you have any idea how much hp gets eaten up by a belt?

>Again, you guys say it CAN'T happen, but yet we DO it. Why not get a clue,

Hooray.

>it would necessarily be larger than the
>engine.
>
>
>
>NOT necessarily.

Yes, necessarily. Because of your belt drive, you have bumped up the
power requirement to a conservative 130,000 watts. Even with a 48V
system that's 2700 amps, requiring four of those Neihoff jobs. AC or
DC, it just don't cut it, because even if you are going to generate
HVAC first you need a transformer capable of converting it to a usable
voltage. This means the even if there is a size reduction on the
alternator, the system is bulked out by the transformers. Then you
have to consider the power loss from the transformers...

> And allowing a very gracious 80% conversion efficiency (which
>would require direct drive off the crankshaft),...

>head out of the sand.

And again, I don't doubt that a few hearty fools have wasted their time, money and effort to do it. But what exactly they did remains to be proven. What I'm saying is that the intended outcome can't even come close to expectations, and that such a setup is one of the most ridiculous contraptions ever devised. Ever hear of the term, "the better mousetrap"?

Hey moped, if you are into restoring Johnson CBs I have a 223 that
needs the works. No mic, but I can dig up a plug (odd 6-pin). The mic
was a modified Turner +2, I believe. I also have two whitefaces and a
Messenger II, but I'm keeping those.

It's been under construction for a very long time. So do you have any audio processors? Not noise toys, I'm looking for a good mic eq/filter/compressor. I'm also looking for a new base mic, something with a little style. Got one?

It means "Stop sending" or "I am stopping sending." There are any number of reasons why this would be desireable, while still remaining on the air listening.

> to restart some old thread (which I probably should be thankful for and will
> regret this question), but am curious how this could come up. I have only

Not all traffic is handled via net. Further, many stations use full breakin keying. Have you ever heard a station send "QSK?".

> excellent opportunity for qrt. An SOS on 500 KHz was answered by several
> stations (including NPN on Guam, NPO in the Phillipeans, and a number of

That sounds like bad procedure. Sounds like someone at NPN and NPO needed to be given a job where they couldn't unnecessarily threaten the lives of others.

> have to stop sending anyways to hear the reply to the question. The long

The Q signals were not designed for voice - they are CW prosigns. And yes,
even on CW you might have to wait until the other station stops sending.

But using Rich's example: Assume that you are copying traffic from a
station, when you hear a weak SOS signal as well. If you are not using
full break-in/full-duplex, then you have to wait until the traffic
transmission is completed. You then can send "QRT". In message handling,
this is an unconditional command. The other stations on the frequency
are not to question the command - but to stand by to find out why they
shouldn't be continuing with the traffic. You can then try to contact
the station sending SOS, if they are still trying for contact.

The specs say it will RECIEVE all those freq's, it will only transmit on the
bands it is authorized to i.e. HAM bands. the only way to make it transmit
on 11m is to open it with a golden screwdriver.

Ahh ok, it is an "Export" radio not to be sold in the US, so you shouldn't
have it in the first place.

Regardless it is still people like yourselves that will eventually cause the
ruination of the entire spectrum.

So you are just advertising all their stuff out of the goodness of
your heart? I don't think so -- that's just a transparent excuse to
try and avoid federal laws about advertising illegal amps. It doesn't
matter because the offer has been made regardless of who owns the amp.
It's called "agency", and both will be held responsible when caught.

That's probably why they are still in service instead of sitting around
collecting dust. It helps to cut down on the clutter in the shack. At least
that would be my prefence anyway.

perhaps you need a new radio doc. nobody locally or dx splashes all 40 of my channels. sounds like you have no rejection. you have to spend money on qaulity equipment if you expect quality communications. the ham bands and the cb band have never and will never be alike. perhaps you should get your ticket an abandon 11 meters because it doesnt seem like your happy there. if everybody in the world was only running 4 watts AM channel 19 would still be full blast with noise everyday and all 40 channels would still be full. thats mother nature doing it not the amps.

are you saying that while running my general coverage tx and rx (yes yaesu designed it for this although they cant import it into the usa like this its easily turned back to how the factory planned) 1-30 megs yaesu ft840 entirely stock other than a little cpu reprogramming that some how i'm putting out a dirty signal by being on 27.990 instead of 28.010? or that my ham amp will all of the sudden be a nasty beast because it was moved from 28 megs to 27 megs? i see your thinking but its seriously flawed. are you trying to impress hams with this thread? its not impressing me. looks like a bunch of fcking crying by a guy who cant get out cuz of all the other guys in toen. well theres a couple choices whether you like it or not. #1 wait your turn to talk everytime #2 stop crying and start buying or #3 leave the cb hobby forever like so many other who couldnt cut it have done or #4 come here and become a troll along with the other anti cb guys. your not new at this so why is it all bnothering you so suddenly?

the radio is designed to transmitt and recieve those freqs. they only disable the tx function to allow it thru customs. why else would they be so easily returnable to full coverage tx? get a clue buddy. yaesu, kenwoods and icoms arent liek your average 148 that needs channeled out by the local screwdriver guys. these radios were designed with the freebander/marine/and commerical user in mind as well as the hams that buy them. most of these radios require no "golden screwdriver" as you call it. usually just punching a series of buttons in the right order or grounding one part or another during turn on or something easy like that will give you full tx between .500 and 30 megs. its 20 times easier to get a yaesu on the freeband than it is a cobra

Still sore about all this? I told you where right, on the subject already. Again I have more of the old Johnson Equipment than originally thought. And the rebiult Valiant (I own two of them) is loaned to a friend just a mile or so from you.

This all sounds great in the education department. And a little snotty personality wise.

> So now tell me, Jay, what kind of a person would spend thousands of
> dollars for an illegal, multi-kilowatt amp that is built for the sole
> purpose of disrupting communications?

I don't know of anyone who does that. Your biased wording shows what a snott you really are, and thats a real shame. The keydowns are a competition, just like any other forms of sports, like racing, wood cutting, who can life the most the highest, baseball, football, hockey, (take a date to a Hockey game that will really break the ice) drag racing, and all the other sports.

But the big thing your missing here Frank is the people, meeting the people, talking over the technical stuff, looking at everyones equipment. Its quit a open and friendly social event. I truly enjoy the people, BBQ, home made wine, looking over the equipment, talking with all the different folks, seeing how they installed all the stuff, and the inner competition rivalry, or bad mouthing of each other in a friendly manner.

I don't know why but when I hear people talk about academic achievement, people skills get thrown out the window. I call them snobs.

Suggest as a self improvemet class in human beings, take the time to go out and look a keydown over, you just may get a big kick out of it.

Hello Moparholic:

I never had to work on a spark gap transmitter before, so I really don't know any thing about them.

But on a friends Sky Boat with a Big Block Chevy Engine, he simply could not hear the VHF Marine Radio, the Dept Finder went nutz-oid, and the CB had a 20 over noise level. And of course as the engine was turned off, the noise went away also.

The MSD Ignition power leads where bypassed, and choked, this helped but did not cure all the noise. Replaced the Ignition wires, and then wrapping the Ignition high voltage wires with copper tape every 2 to 3 inches, again helped, but the noise was still there. Installing shielded wiring between the Distributor and the MSG (I think it was a MSG unit) control unit, greatly reduced the noise.

Replaced the automotive bypass capacitors, remounted the VHF marine antenna, and ground plate wire. Added shielding to the Distributor Cap, and bypassed the alternator and voltage regulator.

The significant reduction to noise was from adding the shielded wires from the MSD control unit, to the Distributor. All the other things helped reduce the noise a little bit also. What a pain.

Cocktail time was called in a few hours early, and we reassembled in front of the fire, ordered out for sandwiches, and told lies.

Not true Tim, and you should know better too. What do you think it would be like if a group 30 miles across town used only 4 watts while keying over each other compared to running 250 to 300 watts doing the same thing? You would really have some dumb CBer on this news group believe they wouldn't notice the difference, get real. If amps didn't made a difference then why do you find it so necessary to run one illegally?

Hello Mike: Becuse the antennas are feed in the Co phased way, you can space the antennas anywhere from 4 to 9 feet, just like all the others are. And it will work great!

Sit thyself down with a large piece of paper, several of them in fact, and a compass. Take one antenna and draw 4" circles, for this purpose 1" is 9 feet or a quarter-wave at 27MHz. Now take and start a second one 2" away, the half-wave that Sparky mentioned. You will notice that the patterns cross along a line that goes halfway between them at a right angle. Do a similar exercise for 1" separation. Now do them both but on the second one, start with a 2" circle and four afterwards, which simulates having an extra half wave (electrical, not mechanical) of feedline in one of them. You will then know pretty much what there is to know about co-phased verticals.

I am always disturbed a tad about 'gain' as if this is some sort of result of following a ritual and saying the right incantation. Gain results from taking signal radiating in an undesired direction and squirting it in a desired direction; power does not magically appear from nowhere.
If you see an FM bay hanging on a tower, it does its thing by taking signal normally pumped straight up and down and arranging for it to go out straight sideways more or less. So a 10-bay gets its 10db from stealing it from other directions and gives the equivalent at right angles of ten times more power. This is what your TV and FM stations mean by 'effective radiated power'.

Co-phasing verticals achieves gain by stealing from one direction to squirt it in another. So expect to lose capability in one direction and gain it in a direction 90 degrees away. Simple as that. There are legitimate reasons for doing it, towing around a 45 foot box is one of them where one is simply making the best of an already-bad situation. Simply being 'kewl' probably does not qualify.

> easily turned back to how the factory planned)

If I were you Tim I would take a look at the schematics for several Ham rigs, and ask yourself why are there "band pass" filters on the output of the power amp in the rig. In some cases you will find one for each Ham band the rig is designed to work on. If the rigs are so clean as you say then those filters would be totally unnecessary wouldn't they? The filters may not be real "sharp" so you may get a substantial amount of power out when operating outside of the passband, however the signal may no longer meet FCC spec's. The instruction manual for modern Ham gear clearly states that "spec's" are not guaranteed outside of the Ham bands.

As an example of the above I have E-mailed to you a PDF file of part of the PA section of a Yaesu FT-817 rig. That rig by the way will in fact TX anywhere it can RX below 30 MHz. If you look at the PDF file you can clearly see the output matching/bandpass filters I mentioned.

You missed two very important points. First, not one of the activities you mentioned are illegal. Second, a keydown is a competition, not a sport. A sport is generally considered to be an 'athletic' competition. You know, something where people actually do something physical, that might even be considered exercise. (I know, 'exercise' is a dirty word with freeloaders and powerpigs).

>But the big thing your missing here Frank is the people, meeting the

You can't do that under legal pretenses? It requires a keydown? My goodness, how have people survived all these years without keydowns? That's pretty sad, Jay, might I suggest the same social functions after, say, a nice game of baseball, or football, or hockey, or... well, you get the picture.

Indeed! And electronically rotate a co-phased radar array and you can
have all kinds of fun.

I have built variations on an old CB theme that you might remember: the
3-vertical dipole arrays that switched drive to one and shorted the coax
of the other two to make them reflectors or just drove all three for omni.

Why do I have the feeling that someone could build the old Dow-Key antenna
switching relays and make off like a bandit???

Heck, weren't you banned from UJ's forum? Heh heh, you should enjoy this group. The guys on UJ's didn't say nearly as much as they wanted to out of respect for UJ. This group is not as constrained. I'll keep watching this thread. Should prove interesting.

1/2 wavelength. For CB that would be about 18 feet. If they are fed in
phase, gain is to the front and rear (assuming they are mounted on the
sides of a vehicle). If fed 180 degrees out of phase (reverse phase),
gain will be to the sides.

Hi Tim I'm on your side but I wonder how you know Leland reported
every post and how fast he was on TOS because he never posted anything
in response to those posts. The only way anyone would know how fast he
was was if they owned the accounts and got the TOS email notices.
Again no offense but just wondering cuz I'm sure if I didn't ask this
question Leland would and we wouldn't want him to get a leg up if you
didn't have an answer prepared.

No we're not and that is why it is so easy to tell the forges from the real me. If you note the headers I have no () around "Unit-69" and the faker does. I sign with "Chesapeake Bay" and the faker doesn't (he doesn't even know where it is). Also another sure way to tell the fake is that he obsesses about IP numbers. All you have to do is look for the TWO "s's in "uppluss" and you know you have tjhe GENUINE Scott.

There is no easy way to wire up that mic. The original mic was
ceramic, and about the only good way to replace it is with a power
mic.

Hey man chill out, LS is one of the most knowlegeable persons
tech-wise in the area. Hey LS I like the enter page where it says
"Noname enter if you dare" and the guy with the monk hood holding the
box looks all scary and stuff. Too bad it doesn't scare off the
"wrong" people if you get my drift LOL. As far as illegal goes you can
see all radios with a * are ham radios. There is a "General Lee" that
is marked with a *, I bet that hams at the ARRL never heard of that
one LOL.

BTW, I want to add that even though I'm not N7, I have always enjoyed star-gazing on a warm summer night. But no, it's not my hobby. No, I'm not balding: on the contrary, I had hair down to my ass up until last year. Yes, I have plenty of friends (which is why I don't need to attend any keydowns), they just aren't CB enthusiasts. And no, I'm not skinny; if you saw me and didn't know who I was you probably wouldn't want to call me fat, either.

I should mention that when seperated by 1/2 wavelength and fed out of
phase, you will get gain to the sides, but you will also get sharp
nulls front and rear -- sharp and deep enough for direction-finding.

There is nothing wrong with any of my radios, they are all in great shape. I own several radios that I use frequently, as well as several that are sitting on a shelf as part of my collection. My regular use rigs include a 148 gtl for mobile use, a uniden washington base, a realistic navaho base, and a president madison base at the ARC office. My shelved rigs include several johnson messengers, browning golen eagle mark IV. All are in top condition, and I get blead because there are idiots in town that are running several thousand watts with opened modulation, hence they do splash all 40, and as I stated in another post, they also wipe out our emergency communication freq's i.e. napoleon pd, county fire/ems freq's. So it isn't

just my radios being effected.

When these guys interfere with emergency communications lives are at stake, this is not a laughing matter. And do't start telling me that the radios we use are poor, or that it is impossible for 27Mz to splash 154Mz because it IS happening.

It's true, It's true!!

Those are EXACTLY the kinds I am talking about! Many moons ago, I worked for Orkin
Exterminating Co, and I started out on my usual route. No sooner than I arrived on the field,
it began to snow and became worse, so I decided to ease my little Ford pickup back over the
30 miles to the 'barn'. The roads became clogged with snow quickly, the 4 lane road became one narrow path that one could see (ruts made by preceding cars), so here I go creeping along
at 15-20 MPH. Remember; I am in a lightweight Courier compact truck wth little weight in the
rear, so this is a hairy journey anyhow--pucker factor of 10. Here came a girl in a Honda up
behind me flashing her lights for me to move like she was on fire. Finally, she wheeled out in
the left lane, which looked like a waste land, and blew by me swerving, shooting me the high sign, and mouthing at me. She went completely out of sight, so I forgot about her, but I thought
"she'll kill herself--IDIOT!" After about 15 minutes of creeping along, mostly guessing where
the road edges were, I saw some wierd lights reflecting off the road banks and the snow--looked really strange. The visibility was so bad, the vista so gray and menacing, yet there were
these odd looking lights pointing at the sky and, what a crazy angle. I rounded a curve, and you already guessed it. There was that Honda 1/3 of the way up the bank and the clear tire
donuts she had made in the snow as she slid round and round before she went up that bank!
I blew the horn, rolled down the right window, shouted, "Serves you right!" AND KEPT GOING! Oh, I made it back home OK.

Then one year, I went to a hamfest in Charlotte, NC. It was March, and raining cats and dogs.
Since the fest is indoors, it made no difference, but after a couple of hours wandering around
among the "goodies" someone came along and said it was snowing Snowing? WHAT? I
went and looked out, and it was a veritable blizzard out! I decided it was time for me to get
my butt back across the Catawba River and home. I avoid interstates in snow, so I took route
74 west, an old but 4-laned road home. Again, I was cautiously picking me way home in my

Celebrity wagon and doing pretty well. Here came a little Escort like a bat outta hell, whipped
out in the left lane and WOOOSH! He passed me at a dangerous speed, throwing snow all over me--including the windshield so I could hardly see out. Why, you #$%&^*#@ SOB, I
oughtta catch you and jack your a** up around your shoulders, you blankety-blank *********!! About 75 yards ahead, suddenly the Escort swerved, did about 4 roundabouts
in the road and hopped up onto the median facing back the way he came. It was so funny, I
forgot about being mad, and started laughing. As I drew abreast, I opened the window and
yelled, still laughing, "That'll learn ya, durn ya"!

I would go with a 3CX1200D7 or Z for what your looking for. The A7 is a first gen. and the newer ones really are an improvement.

Put at least 4Kv on the plate to get good linearity and gain. You can run up to 5Kv safely, 6Kv isn't unheard of. As the plate voltage figures go up, your gain goes up, but so does the problem of instability.

Swamp the input to get stability back, if you need gain, but then you end up dropping the gain neway, but pick up more linearity (usually).

For 5Kw, I put a pair of 1200s in a Drake L4B, and rework the power supply. Others have done the same.

If you want a single tube to do 5 grand, a 3CX2500 or 3CX3000 (both have 4Kw plate diss) will work wonders.

Enjoy, they are all illegal to use on CB over 12 watts PEP SSB or 16 watts PEP AM.

Toll_Free

I like the 1200

Mast?

If your putting one of those antennas up, the proper rotor won't sit on top
of a mast.

Do it right, get a tower, thrust bearing and HAM IV at the MINIMUM. T2X
Tailtwister would be much better.

In common (biased, non-regulated) use, expect to run them about 15 volts and get away with it.

With regulated bias, I run my 16 pill at 16 to 18 volts, but the bias is always fixed, current regulated, and that is the only thing that keeps it up and running.

In Class C configuration, people running them at 21 volts all day long. In keydown operation, you can get them up to 26 to 27 volts, but your keytime is very limited.

Hope this helps.

Everything's comes to a halt at present due to other commitments.

I've decided to not go back on the air mobile until I have the amp that
I want built with my YC156 tube.

Such high voltage and power level is somewhat above my station as I've
only ever built an 8-pill and that was from one of Lee Martin's
Skywalker kits, he of Myrtle Beach, SC.

Either I find someone willing to take a commission or I win the lottery
and be the first ham/CB op with a Henry 8K Ultra RF deck in the rear.

I'm sure my Electrodyne would be man enough for that single 3CX3000.

Aside from that things are going fairly well selling low power AM and FM
broadcast transmitters on my site.

I'm also looking at investing in a US radio station. One of those ma &
pa stations. The FCC allow a max of 25% ownership by a foreign national
and am at present looking together with two others into a AM/FM combo
plus second FM 10 miles down the road in MO. Not my favourite state but
it would get my foot in the door and it's currently billing $20K+ per
month gross.

I noted on the FCC site that a good number of stations that have gone
quiet both AM and FM are in your state of Texas. What's happening down
there? Are all the big corporations taking over the US and pushing the
small guy out or are they all located in the middle of nowhere with
their 1Kw TX's only talking to sagebrush and tumbleweed?

All it takes is some yoyo fiddling with the neutralizing cap on a triode which will in fact give more 'bird watts'. Might I make a suggestion in two parts: First, it is a bit unbelievable that you do not already know who the yoyos are; TVI etc. I will make you a bet the Napoleon PD can take you to the door(s) as can probably every alderman on the City Council. If it is a mobile, it will be readily recognizable from the antenna(s); the loading coil will be a moose and the whole thing will look like a regular antenna on steroids.

And these multiple pill mobiles, a lot of which like the old micors keep the B+ on the system at all times, can act as giant broadband mixers because there is nada as far as tuned circuits between the collectors and the antenna. They will pick up the local FM and TV stations and depending upon the IMD products spread joy and happiness across the spectrum particularly when transmitting but often when just sitting in the parking lot at the Probation Department or the County Jail.

As you are more than likely on a first name basis with both the Police Chief and Fire Chief, ask them. You may well be the key log in the jam that comes down on some yoyo's head. You might want to mention that there are local ways to deal with bozos and get the City Attorney or County guys

humping on a local ordinance. There are technical considerations but it is pretty likely that the outfit that fixes their radios is technically compentant to be the expert should it be needed. Then let the Chiefs run a little interference with the prosecutor and local judges to set the standards and one quiet nite the man gets a visit. Senator Feingold's office for one can probably help the legal eagles.

You are in a unique position, Doc. Use it.

I know that's why I was thinking I have some buds who like to drive
around at night with a baseball bat and knock off mailboxes (we call
it mailbox baseball it's a sport like any other we have scores and
teams etc) and so far the cops have not caught us so at some point
they will just have to give up and make it legal like drag racing.

Are you putting me on?! When I left WI, I put things out for sale or grab and my two Dow-Keys were gone so fast the vacuum nearly took the garage doors off. They make a current version but it is for high-class work with a price to match.

One nite in WI over several pitchers and the onset of kreusening poisoning we were discussing verticals which in that part of the state and in fact most of the state are as my dad would say as useless as a third tit and not nearly so decorative. Central WI is sand over granite that has been there since the big bang so ground rods are strictly proforma, meets the code but no one seriously expects them to have much effect. The ground losses associated with a vertical are just ridiculous. There is a 500 watter built into a swamp on 1260 that fades before you get to the airport. Because of the lack of ground conductivity the Navy put Project ELF in Clam Lake that loads the planet as an antenna; they do not want it shorted by conduction between feedpoints.

So for giggles and to prove a point I built up three folded quadpoles for 15 meters with a feedpoint around 500 ohms, a 4:1 balun, and a 75 ohm Q section to match 50 and allow some separation and used some relays from a pinball machine to do the switching and shorting. The idea was to make the ground resistance a much smaller part of the pie. It worked pretty well for something that had its ground as the rebar pegs used to hold up

the 10-foot 'towers' and 16 penny nails pegging the four surface radials.
Using pie plates as top loads added to the effect.

I suspect that the 3 vertical dipole caper worked really well until the 6
sweep-tube line-e-ar blew the switch box to smithereenies.

Dick, you bring up some interesting questions. I've seen the test results on some of the new solid state no tune amateur amps. Although one should change the bandswitch on 'em when changing bands, they will usually allow close to a 3 to 1 frequency change without changing the bandswitch. Very wide tuned circuits indeed. Also, their IMD products are not nearly as good as most amps. You bring up an interesting point. In the sticks, probably no particular problem. I was at a PLC class - sitting about 400 feet from a commercial AM broadcast station a couple of years ago. I wonder what would have happened had I used that amp in my car on 75? The station is at 1320 KHz. I suspect there would have been problems. I miss the old pi networks. You didn't need an antenna tuner. I could load everything from a ball point pen spring to that several hundred feet of 8 gauge wire I had strung across the property. It worked. Back to the point at hand - not all gear is dirty; however, if you overdrive a decent amp with a clean radio, you will flattop and have a dirty signal. Ditto overmodulating. Modification is a dangerous game. As far as the folks who fix the radios - been there, done that. Why would an engineer put something in a radio if it works better without it? Now there is a question worth pondering.

Yes thats right folks the living fag Landshark is begging for attention from
me again, first he lies and says I am killfiled again and I use the same nic
check the rest of the thread and then he crys and says I changed my nic
again while it has been the same. He is craving attention from me. Why else
does he repond to me If I am killfiled, what could he want to say to me If I
am killfiled? Nothing of course becuase he likes men and like when we talk
down to him, ain't that right sissy pants... You fuckin loser.

Asslicker Landshark wrote in a previous post.: Changed his nic 3
times in three days,
Just is starving for attention.

Kill filed for the 30+ time under
some 60+ alias.

I resent that why am I accused on being Boobner if I ask a perfectly reasonable question? Why does everyone get so freeked out as soon as Noname is questioned about who he is? Look I respect you guys I am trying to learn here and you are acting like assholes about it instead of the experienced dudes I know you are. For months we have beeen saying how the FCC is lame and no one gets caught but everyone acts so afraid to give out their ID or any details I don't get it. Hey I have been down to Tracey's Landing at the DC break and hung with PopBottle and RazorBlade and the AC sky gang so what's the big deal? How can we attract anyone to our sport if everyone's so paranoid and closed all the time.

In the VHF/UHF biz these amps require isolation from the antenna and there
is in fact such a thing as a uni-directional coupler for the purpose. You
don't run one from a site with 43 others in the area, believe me. I agree
with you, a little more tuning would improve the world in general; while

the pi would load a lot of things, the match offered the tube might be another story entirely and as a pi is in fact a lo-pass filter even with it you and the BC station could easily have been a threat to the 2 MHz Marine Band.

Yeah, I wonder about the 'if in doubt, cut it out' school of repair as well. The usual engineering problem is that the Accounting Gnomes make you take it out and call it 'Value Engineering'. I think here it is a case of 'dazzle 'em with Birdwatts and baffle 'em with Bulletc' while taking their bankroll. There is a thread on rec.radio.shortwave about bypassing rectifier diodes to take out the overshoot that produces VLF hash in the power supply; seems Sony actually has the pads in place but no by-passes. The Value Engineers strike!

Operating a receiver open to the world is not all that bright either. If the receiver LO is not twice the sum of everything in the first mixer you have the familiar overmodulation problem. So you will see on really good gear, a double balanced mixer, some decent bandpass filters, and proper matching of everything coming out of the mixer to keep it from having an SWR problem and having trash reflected back to remix. This is the usual cause of rice-box front ends BTW. But when you can buy cheesy front ends in Guandong Province really cheap and your customer is either a nincompoop or a cheapskate or both, you can guess where the Value Engineers will go.

You pay a price for solid-state convenience and that price is truly lousy IMD performance; not a lot different than audio. I am looking forward to the 42/36 volt systems out of Detroit soon to make power FETs a bit more practical. Makes impedence matching a snap and really cleans up the bipolar act.

Well the CE breakdown is 45V, so why not push it even harder? I thought you guys were into pushing things to the limit. It's really out of character to leave 20 - 25 volts headroom. Yeah! More volts, more power! More power, more... uh... something! And more something, more... hmmm.... hell if I know. Why would anyone need to tweak a kilowatt amp for a few extra watts? Trying to get that couple extra inches on a 20 mile ground wave?

I remember some of the older radios (Icoms, I think) had harmonic
resonators on them. Real high quality stuff. Most of the radios I see
now have at least one of those filters removed for the leechband.

I always wanted one of those! No joke. I even saw one a couple days
ago near the state line and I almost stopped to see if the owner
wanted to sell it. Traffic was moving too fast, tho.

>Why do I have the feeling that someone could build the old Dow-Key antenna

First:

HAPPY NEW YEAR TO ALL OF YOU WHO READ THIS!

Next:

A little trivia from a former Johnson Factory Warranty Service person.....

The Johnson Messenger 223 was just a black face, (Messenger II), turned sideways in the chassis with some added frills like a 23 channel synthesizer and a large meter.

It was about as good a single conversion unit as you could get at the time.

The only differences between the black face (Messenger II) and the white face (Messenger I), besides the color of the chassis and face, was that the Messenger II added another IF stage to the receiver to make it more selective and a few more channels on the selector to buy crystals for.

(The black face did have a tunable receiver option that the white face did not have)

The best mike for those units was a D-104 with a crystal mike cartridge in the head, used on an un-amplified base like the UG-8.

Using a high impedance mike allowed the mike preamp tube (a 12AT7 or 12AX7) to work as a speech compressor when you talked too loudly into the mike because it shifted the tube operating point due to grid leak bias caused by the overdrive.

Using an amplified mike defeated that feature and made the radio sound a bit louder but it caused some serious overmodulation (aka TVI) problems.

It's a shame that there are no longer any American made CB radios.....

Regards,

Dennis O.

John,
I agree, a 175-200 amp power supply isn't exactly 'small',
but, it's certainly not out of reason. I think I would much
rather have a 'monster' power supply than do the 'over-volting'
thing. You can always use it for something else where 'blown'
transistors are sort of useless...
'Doc

NO, the 148 and the 29 use 2 different boards, different SIZES so there is
NO WAY they could be the same thing!

Also this radio would NEVER do 26-30mc AND 40 up & down?! Plus NO WAY could
it ever do 100 watts also. Sounds like a drug head selling junk made in RED
China!

Yep, I have a theory about N8, as to WHY he is so 6th plank pinkod up!

I e mailed him a question direct but he never answered me. I can only guess that he is AFRAID to answer the question. The question was: DID YOU Mr. A-Dare ever live in the Cleveland, Ohio area? The reason WHY I asked is because when talking to Moparman when I was up there last time on the phone, he reminded me of the DUG A-DARE guy from TV Channel 3. MY theory is that he DID live in the Cleveland area, and that his dad was DOUG ADAIR from TV Channel 3 there that was on for years from the 50's through the 80's or so. Little Douggie HIPPY Freq. (Freak) was born late 58 then, as his web page states. I thought N8 was a crusty old RED Commie pinko hamateur pusher, until I see on his web site that he is younger than I am. That would probably make him a long haired HIPPIE FREQ. ! Getting back to my theory---since daddy A-Dare worked for channel 3, he found out that CB'ers in da hood were causing TVI, bleeding over from TV Channel 2 onto him on da video screen. So begun daddy A-Dare's hate for CB, which makes Douggie a 2nd generation commie/hater of CB radyos! Can anyone else in Cleveland or Too-Lee-Doo verify this theory, or am I just spewing theories without fact? Silence is accquiessing to da fact! (Don't laugh too hard) & (Hippies sorry about offending you long haired creeps, but there may be a pinko in your midst)!
Dave!!!

That would be a 12AU7...

> to
>work as a speech compressor when you talked too loudly into the mike because it
>shifted the tube operating point due to grid leak bias caused by the overdrive.

Uh, I don't think so, Dennis. That half of the tube is run on
contact-potential bias, which is a bit different than grid-leak. Also,
the mic is DC isolated from the grid. Because the audio level is so
low directly from a ceramic mic the signal is linear -- the
compression effect is caused by inadequate grounding of the cathode on
key, which is easily fixed with a bypass cap.

> Using an amplified mike defeated that feature and made the radio sound a bit
>louder but it caused some serious overmodulation (aka TVI) problems.

Using an amplified mic is about the -only- idea because there is such
a wide variation in the output levels of ceramic elements. Only a mic
with variable gain could possibly match it up without a lot of
headache. Believe me, I have done this before many times before.

> It's a shame that there are no longer any American made CB radios.............

No doubt!

Hello Sparky:

For a mobile installation? 18 feet? Two vertical feed in phase don't
need to be 18 feet apart.

I am sure he's talking about a normal installation on a vehicle.

To be honest I don't do much sailing Train, but I do get around the
hiways a bit. There was a high speed chase the other day with the Anne
Arundel County Sherrifs after a buddy of mine who had accidentally
taken some money from a convenience store cash register heh heh.

How about the Toshiba 2sc2510 or the Motorola MRF-422. These devices
are 28 volt and rated at 150 watts PEP. They cost more but your get 50
watts more power per device and the power supply is more manageable.

I'd like a loud, obnoxious PA for my car. (Its so much nicer to say "close your door so I can park in the space beside you" rather than resort to honking or rude gestures.) The normal little CB speaker is too soft to be heard over the engine. I have a 100 watt speaker from an old ambulance, but I don't think a CB could drive it without being amplified. A police siren's PA feature would be perfect, but in my state installing a siren is illegal.

Is there a way to permanently disable the "siren" features of a Federal siren leaving only a dedicated PA? Or, is there a way to amplify the signal from a 5 watt CB to drive a 100 watt speaker? Does anyone manufacture a loud PA?

I know Landshark, it's horrible just horrible. I don't want to read
his posts either. Here is a copy of the email I sent to abuse@home.net

Dear home.net,

One of your users middlefinger@home.net keeps disagreeing with me in a
newsgroup. I'd like to not see his posts at all. I have told him to
leave. But instead of leaving he is deliberately changing his screen
name so now I am having a hard time filtering him out. He is violating
our rights or something. So can you please cancel his account.

Once during my trip to Northern Cal I went star gazing in the Marin
headlands with Landshark one night. I was really interested in seeing
the constellations but Landshark kept grabbing me and saying "I want
to look at Uranus". Ha ha what a joker he is, Uranus isn't visible
that time of year from that latitude.

> How do I put this into a radio ? Thanks

Talk back is very useful because it's like Mr. Microphone it's so cool
to hear yourself talking and sounding like a big ole southern dude.
What you need to do is get an old tube type stereo amplifier like a
Marantz and take the light bulbs out of it, very important to do that
or your SWR will be too high. Hook up the amplifier to the RF input of
the PLL and watch out for phase distortion for God's sake, then adjust
the volume so you can hear yourself. I don't mind helping out Newbies
like you so anytime you got a question the more technical the better
just ask old "doc" Scott.

I heard different. I heard his Dad is Red Adair the fire-fighter, you
know the guy that battled the oil well fires in Kuwait. The story goes
that Big Daddy Red made Doug work as a firefighter in his teens and
there happened to be a gay CBer on the crew that made a pass at Doug.
Well Doug knew karate and damn near chopped the guy to pieces before
the crew came and broke up the fight. After that Doug was walking
around Galveston Texas and some Gay Born Again Christians tried to
molest him. Remember now Doug was only about 13 at the time but he
kicked their butts bad. The Christians were so scared the head
preacher offered Doug the sexual use of his wife, saying that's how
Born Again Christians made peace. But Doug refused. Course this is
just a story a guy over in Baltimore told me and it may not be true
but it sure as hell is interesting, huh Dave?

I use a mailbox scanning program called "POP3 Scan Mailbox".
You can view a list of e-mails on your server along with senders, subject, file sizes, dates, and who each was addressed to... without downloading them first.

The program can filter e-mails by sender, subject, or who it is addressed to (such as spam mail lists). You can set it up to either kill unwanted mail, or kill any mail not in the accepted senders, subject, or addressee lists. You can also manually delete any mail you think may be suspect, or view part of the text before deciding.

I run it while the news messages are downloading, then get Outlook Express to download the remaining mail after it finishes the newsgroups.

I got it through a news message link, and have no record of the exact URL now. The URL in the "readme" gives the URLs as :
http://www.kempston.demon.co.uk/smb/
and
http://www.netcomuk.co.uk/~kempston/smb/

It's totally free. If you have problems finding it, e-mail me ,
http://www.brainbuster.mybravenet.com/mailer.htm
I could send you a copy.

===

Hi Darkhorse.

This was already covered once in this CB newsgroup, but, quoting from
the "NIV" (New International Version)...

--
John 1v1 :
In the beginning was the Word, and the Word was with God, and the
Word was God.
--

So, we establish that the "Word" is God.

John 1v14 :
The Word became flesh and lived among us. We have seen his glory, the
glory of the one and only Son who came from the Father, full of grace
and truth.

So, Jesus is the "Word", and the "Word" is God.
God the Father, the Son, and the holy Spirit.

Jehovah (Yahweh, Jahweh) : He who was, is, and will be always.
The word Jahweh was considered sacred, so "Adonai" was used in its place.
The vowels of Adonai were added to the consonants of Jahweh to form the word
"Jehovah".
There were also several other names used for God, each having it's own
meaning.

Happy new year.

Brainbuster.

If you have problems understanding how the holy trinity can be three,
yet still be just one and be known by so many names, consider the
Unholy Trinity...
George the Pipedream, the Middlefinger, and the Shrimp Biskit.

New Year's Resolutions for Internet Junkies...

I will try to figure out why I *really* need 9 e-mail addresses.

I will stop sending e-mail to my wife(husband).

I resolve to work with neglected children -- my own.

I will answer my snail mail with the same enthusiasm with which I answer my e-mail.

I will stop sending e-mail, ICQ, Instant Messages and be on the phone at the same time with the same person.

I resolve to back up my 12GB hard drive daily...well, once a week... okay, monthly then...or maybe...

I will spend less than one hour a day on the Internet. This, of course, will be hard to estimate since I'm not a clock watcher.

When I hear "Where do you want to go today?" I will not reply "MS Tech Support."

When I hear a funny joke I will not reply, "LOL... LOL!"

I will read the manual... just as soon as I can find it.

I will think of a password other than "password."

I will stop checking my e-mail at 3:00 in the morning... 4:30 is much more practical.

I resolve... I resolve to... I resolve to, uh... I resolve to, uh, get my, er...

I resolve to, uh, get my, er, off-line work done, too!

Brainbuster.

Yeah, but the guys who want five star performance out of their gear, and
want wide frequency RX will continue to bitch about the poor performance. It
seems they can't get it through their head the point you make above.

> You pay a price for solid-state convenience and that price is truly lousy

Those high voltage systems may take longer to get out than you think. The
main problem is how to handle all of the old 12 volt stuff people have. Use
a dual battery system, or go with the high voltage battery system and a 48
volt to 12 volt DC to DC converter.

748. FS: Numerous CBs And Uniden 2510

Newsgroup: rec.radio.cb
Date: 2002-01-05 14:52:41 UTC
From: radioears@aol.com
Message-ID: <20020105095241.06277.00002483@mb-mh.aol.com>
Source record: 111040

I have decided to sell these separately as below (originally lumped together as a package several weeks ago) and have added a couple of radios to the list. Thanks for reading the posting.

CB's: Mobiles - All are like new and work perfectly and include handheld microphones. No scratches or dents.

Uniden President 2510 - modified works perfectly, with manual, original handheld mike. Output 20 watts+ on SSB: $185 firm.
Cobra 148 GTL (AM/SSB) with built-in freq. counter: $185 firm.
Cobra 18 WX ST (AM): $50
Cobra 25 WX ST (needs power cord): $75
Maxon MCB 45 W: $35
Midland 77-120 ESP2: $40
Realistic TRC-465 (AM/SSB): $100
Shipped postpaid and insured - money order only.

Older CB mobiles:

Pace CB-143, 23-channel with microphone. Fair condition, works. $25 firm, postpaid
Royce I-600B 23-channel mobile with microphone. Fair condition, works. $25 firm, postpaid.

CB Walkie-talkies:

One PAIR of old classic Realistic 40-channel TRC-216; minus "dummy batteries." Excellent condition with manual and rubber antennas. $75 firm, postpaid and insured.

One pair of old classic TRC-206 Realistic 3-watt, 3-channel CB walkie-talkies. Excellent condition, both work. No manual. Includes one transmit 27.125 and one receive, 26.670 crystal in each unit. One is minus hand strap and both need "dummy" batteries (can still use today's NiCads). $75 firm, postpaid and insured.

CB Bases:

Texas Ranger 696F SSB base, excellent condition, no scratches, in original box with manual and works perfectly. $250 postpaid and insured.

Cobra 2010 (replaced Cobra 2000). Excellent condition, manual, microphone. $200.

Classic Base CBs:

Uniden Washington AM/SSB base - This is a classic, OLDER UNIT - in original box, manual, bracket, microphone, no scratches and in excellent condition.

Works perfectly. $250, postpaid and insured.

Regency CCR-142 AM 23-channel base with handheld GC Electronics power mic. Checked out five years ago and worked. Probably needs tuning. $45 firm, postpaid.

Lafayette HE-15, 5-channel base with push-to-talk switch on CB case; needs a microphone. Checked a few years ago and worked, but probably needs tuning and switch cleaning. $50 firm, postpaid.

Lafayette HE 20A 23-channel base CB, needs original mic, but I will include a Courier CMM-1 handheld mic (minus connector). Checked a few years ago and worked, but needs tuning. $50 firm, postpaid.

Contact Harold at radioears@aol.com. Please don't respond to newsgroup as I only check my email several times daily. Postal money orders only.

Did you ever try a rhombic in that dirt? This area here is mostly
basalt, not much different than granite in conductivity. It allows an
ok ground wave below about 3MHz but really sucks above that.

Because the FCC doesn't require any form of pre-emptive accountability
for CB radio. Without order there is chaos, and it is the FCC's
responsibility to impose order on the spectrum. Maybe you should ask
them the same question.

Carl Wrote:

If at least half the speeders in r.a.d would CUT THE CRAP and admit
that speed increases risk, I'd have no reason to keep repeating the
truth. Here are the main FACTS I have been repeating for months:

1) All other factors being equal, when you drive faster you will have
a harder time avoiding unexpected obstacles because of your greater
momentum. This fact has never been logically refuted, only evaded.

2) Unexpected obstacles *by definition* cannot be predicted. Every
driver has encountered them and will continue to encounter them.

3) The combination of higher speeds and unexpected obstacles causes
thousands of crashes each year when speeders are caught by surprise
and can't stop in time. These crashes have been killing and maiming
people since the automobile was invented.

If you want me to go away:

A) Stop denying the clear cause-and-effect relationship between speed
and crashes, i.e. that speed is not a major factor just because it
isn't always the *only* factor.

B) Stop changing the subject to 85th percentile stats and other
narrow contexts to distract from the many scenarios where speed kills.

C) Stop being so entrenched in a habit that you can't see the risk it
creates. Cigarette smokers use remarkably similar arguments.

In other words stop lying and act like grown men & women.

Yes you are right, I did have it my mind that he was talking about
Mirror mounted antennas on a truck. Self induced reading
comprehension???

> And by the way, Jay, did you
> notice that I was polite? Did I pass your behavioral scrutiny? I sure
> hope so, Jay, because if I didn't that would really ruin my day....

Yes you were polite, you always catch more flies with honey than with
vingar. I certainly wouldn't want to ruin your day.

The maxium gain from two antennas feed in phase, will result when the
antenas are spaced at 1/8 a wavelength apart. Which is were my Rum
Soaked Brain (RSB) creatlly tuned in on the Mirror Mount installation.

I owe, I owe, so off to work I go.....

> http://www.transmittersrus.com

tell me phil....what makes this radio so desirable.....seems like everytime i see something from harris get on fee bay.....it goes for a pretty penny.......$700.00 and counting....whew!!!!!!!

oh yes......stations are being bought up around astrodome city also...talk to clear channel communications.....i don't like it when these big corporate buyers start buying them ....when one group owns several stations, i would think that it kind of shades the competition.....clear channel came in here and bought up several stations. that way, they use one or two traffic people and they do the traffic on several stations.., etc, etc.....they made one of them a all talk station , which it was already...they just juggled the host.....they made one a all news station, which it was already, they just juggled the format.....and sometimes they juggle the disk jockies between stations......oh well....it isn't like the old days but i guess it is good for the bottom line.......all i can tell you is that i remember the day rush limbaugh got on the radio in 1988 and nobody gave him much of a chance.....now they worship his ability to bring in advertising dollars because of his twenty million plus listnership guaranteed.........if you could have just been in on the beginning of the rush limbaugh phenomenon, then you would have a automatic money generator. however..limbaugh suddenly went completely deaf......so they started dictating to him, what people were asking him, and he would them answer....this went on for a while until he got his colinear implant......now he can hear somewhat, but think about it.....the main reason why clear channel came in here and bought stations in texas was because of rush limbaugh.....if he had to quit because of this, clear channel would have had to absorb a huge loss in advertising revenue plus a salary guarantee of two hundred million........can you just hear a collective sigh of relief in the boardroom of clear channel.....i could and i still can..........

763. FREE antenna radiation pattern generating program

Well we made it thru conversions to 12 volts from six, positive ground to
negative ground, and the jolly boys from Mopar installed an alternator
that caused more urban legends than keydowns until the General followed

suit. We will survive this one.

There is indeed a problem wiring in your computer, cell phone, bottle warmer, etc. A bigger one is getting Joe's Tow Service and Funeral Parlor equipped to jump start you in East Nowhere. In order to pave the way for disc brakes it was necessary to start selling drum turning machines with an extension shaft that had this funny kit for refacing rotors no one had seen yet.

Some view them as problems, others as marketing opportunities.

leland, at night i have no trouble and all 40 channels are always static free. i was reffering to the day time which is what everybody is complaining about when they say the cb band is trashed and unusable. whether the entire country was running 4 watts or 4,000 watts it would still be unusable in the day due to the sheer number of people active on cb radios. myself, i run power because i like to talk and i like to talk when i want to talk. i chase rare little countries on 11 meters and like to talk to the odd places and using power makes it alot easier to do so. clean power imporves comms, it does not disturb them.

OK, you may well have a point: even if everyone did run 1 watt when Sol is spotting it is going to get get pretty loud.

But it would seem that it is a better argument for a good beam than it is for omnidirectional heat.

A close post has a guy looking for 3 kw or so for his base. You noted that things quiet down at nite, a sure sign the spot cycle is on its way down. About the time he gets it all installed, he will be talking to the trees. Oh well,

Dick NBK

Hi SD,

>tell me phil....what makes this radio so desirable.....seems like
>everytime i see something from harris get on fee bay.....it goes for a
>pretty penny.......$700.00 and counting....whew!!!!!!!
Maybe Harris aficionados know that the quality of anything Harris if fairly high in as much as they are were military contractors, they make the FM broadcast exciter industry standard (The Digit) and of course a whole line of other high quality and expensive gear so 'it must be good'.

I've collected a whole bunch of rather unusual HF gear in the past 20 years, I hate Jap crap so have tended to collect American gear, WJ, TWE, Collins and not forgetting my Metron amp's (I have two both brand new and unused) and a Ten Tec Hercules.

Toll and Dennis know I bought me a Suburban a couple of years back. I hold the world record for 'viewing a Sub' in Auto Trader on the web and flying out a week later to St. Louis, MO to buy it and have it shipped back to the UK.

the only thing I don't have is a Harley, I leave that up to Dennis #12:-)

Snip
>the rush limbaugh

Of course I've heard of Rush but had never read up on him. sounds like he's the Wolfman of talk radio.

Clear Channel is of course taking over radio. I think they could only ever own big city radio, the last thing on their list of priority's is local 'community' radio.

Much the same happens here in the UK. A handful of large PLC's Public Limited companies own the vast majority of commercial stations. You really need big bucks to start a station here in the UK.

That's one reason I sell what I do.

Kind of levelling the playing field by keeping our FCC the Ra on their toes and paying the mortgage at their expense.

Better end this thread here before someone points out it's off topic.

Oh well, I did mention a Metron 8-pill.

From: gil <gilpi@mindspring.com>
Message-ID: <a17m6d$f6k$1@slb6.atl.mindspring.net>
Source record: 111124

I use my cb mainly in SSB mode and have been trying different microphones to
get the best close to broadcast quality audio that I can.
Would using a low impedance 400-600 ohm high fidelity stage microphone
improve my audio?
I want to stay away from the power microphones.

Any thought comments appreciated

Gil

790. Re: Co - phase on CB

Newsgroup: rec.radio.cb
Date: 2002-01-05 20:19:55 UTC
From: 'Doc <w5lz@icok.net>
Message-ID: <3C375FD7.CE3DAF94@icok.net>
Source record: 111127

Jay,
Antennas can be 'phased' at almost any distance. The
radiation pattern only developes into a 'uasable' pattern,
meaning lobes of maximum radiation in some predictable and
'desired' direction in relation to the antennas, at certain
distances between antennas.
The maximum signal strength produced by two antennas
fed in phase, or out of phase, does not occur when the two
antennas are spaced 1/8 wave length apart. When spaced
1/8 wave length apart the radiation pattern of phased antenna
system is more omnidirectional than directional, sort of
a football shape. The farther the antennas are seperated,
to some distance around 1/2 wave length, the larger the
lobes and deeper the nulls. After about 1/2 wave length,
the directional pattern starts to loose it's distinctive
'figure-eight' pattern and developes lobes in a number of
directions.
All of this stipulating that the antenna's environment
does not distort the radiation pattern (which almost never
happens). In practical applications (real world), the
radiation pattern produced is not the one usually seen in
graphs (especially those furnished by antenna manufacturors).
The pattern is usually a very broad one, not sharply defined
at all, and more closely resembles a 'foot ball' rather
than having sharp, distinct nulls, unless much more care is
taken in the phasing arrangement than is ever taken by the
average person. That exceptional 'care' is wasted in a
mobile installation because of the constantly changing
environment. A fixed instalation is a different story,
though. Some examples of that are the direcional antenna
systems used by broadcast stations.
'Doc

PS - This information is factual, my spelling sometimes isn't...

Landshark,

I know you are trying to help us rid the NG of George who is the sole problem and the only cause of our troubles here in Rec.Radio.Cb, but I am asking could you PLEASE lay off of home.com?

Reason is I use home.com too, and if you complain and tell people to filter it I am going to get flushed along with the problem. We agree that our goal is to get rid of legal talk and differing opinions or people we just don't like. Let's stick to that plan and leave @home.com alone.

It will be bassy. Try a D104 just keep the gain down. If you want broadcast
type of audio, get pro audio equipment. Check out www.fullcompass.com . If
Filter widths and coupling/bypass caps in the audio chain will have the
biggest effect on SSB quality

Greetings!

In a word, NO!

It's just a gimmick, something to wake up the neighbors with.

Had a guy up here in my locale that had been trying to sell a Euro 3900 [suffix ?] done up with the TT - and a 200W boot. Never sold.

Details are sketchy, seller imbibes quite a bit. I believe it's still for sale. It's been nearly two years - so I don't know about the status. Only now it doesn't have the TT.

How it got started was after the purchase, he put it up, and used an A99. Then the neighbors complained, and since he's a renter, almost lost the lease due to some issues.

The guy was pissed off about the deal, couldn't get an RMA so he could get his money back. They claimed "warranty repair only - no refunds" on the phone, so he put it up for sale and went with an RCI 2970. Can't blame him, and the neighbors quit bothering him, so he's happier.

Since it wouldn't sell, he had to take the radio to the local shop to have the TT undone. Seems that the work was some simple changes to the output network and some Driver and Final re-fits of different parts, along with some bias adjustments. A local tech re-worked the back end Final section and managed to salvage the radio.

I stop by the shop on occasion to see what's new and heard this direct from the tech at the shop. The tech has re-done 3 radios from other locales with similar changes and due to complaints and failures. If the other two were from EEI, I don't know, only the one. The tech is not a real happy camper when it comes to fixing brand new radios from another dealer that got screwed up by the unfortunate owner wanting something done by someone that "clearly didn't know".

None of the locals yak-yuks liked what they heard back then, before the "refit" back to stock - and the radio hasn't been heard from in a while. Perhaps it's in his XYL mobile [and that's a story in itself].

On a more serious note, CBtricks.com has a write up on a TT test. The results and the opinion at the site are similar to what I've heard about another of their TT'd radios someone bought from them, up here.

Since the fiasco, no one in town has bought anything from EEI [AFAIK]

You get something - but it's not worth the hassle. It'll turn a nice regular radio into something disposable.

who
>couldnt cut it have done or #4 come here and become a troll along with the
>other anti cb guys. your not new at this so why is it all bnothering you so
>suddenly?

First of all, your ham amp was not designed for 11m, it is illegal to
make,manufacture an amp for 11m, so an amp being run on 11m will have
harmfull spurious emissions / harmonics.

How is my thinking flawed? It is simple to see, less pollution means less
mess, and the splattering of the air is pollution.

I am not out to impress anyone, I do not care who thinks what of me, I never
have. If people do not like me for who and what I am, screw them I do not
need them anyway.

I could be like most of the people here and use the attitude "if I can't get
out I'll just use more power", all that does is cause the problem to
intensify.

I am not a troll, I have partaken in discussions here of an informative
nature, I am here to share knowledge, and to gain knowledge.

And last of all, this isn't bothering me all of a sudden, if you go back to
my first postings, I said from the beginning that I was all for doing things
the legal way. I've just never really voiced my feelings about it all that

much. I know that those who want to run power will, and all the yelling, cussing ect, will do no good to stop them. But I know that there are many intelligent people here, who just might listen to reason.

So I have stated my thoughts.

I hope everyone has a good weekend, I taught a first aid/cpr class this morning, and am now relaxing at home with a good cup of coffee and listening to some good tunes on the stereo.

Like Tim suggested you can use something with a large metal surface, a friend of mine moved into an apartment complex where he was not allowed to put up his base antenna, so we took a metal filing cabinet and placed it in front of his window in his living room, and mounted his radio and a wilson 500 to it,, grounded the cabinet and antenna to the radio, and it works sweet for what he needs.

Hope this helps.

Source record: 111144

Gil,
A 'stage' microphone by it's self probably won't do much
for your audio quality. A 'stage' mic plus a graphics equalizer
will give you more control over your audio. Your more or less
are getting into a loosing game to start with. The normal signal
bandwidth of SSB doesn't allow the so called 'broadcast' quality
audio that is possible with AM or FM, which have a very much
larger signal bandwidth. The additional high and low audio
frequencies don't contribute that much to signal inteligibility
to start with. And, if your signal isn't fairly strong at the
receiving station, increasing audio bandwidth only 'muddies'
audio, it doesn't help it.
The impedance of the microphone has very little to do with
the 'quality' of it's audio. It does have a great deal to do
with
how well your radio 'likes' a particular microphone, though.
It's
much 'better' to use the correct mic input impedance than one
that's
not the same as that of the radio.
'Doc

Good post...

I'm sorry... although I agree with your statements about AM... I stand by my original reply directly below.
It's like every car engine burns oil. It's just a matter of how much. The same applies here.
If you go much deeper (more than one fi) into class C than I agree you could have serious distortion problems with a wide-band type amplifier.

When the carrier drops to zero on the AM signal... we are talking millisecond intervals with voice as the modulating source. This can't be detected by even your maestro ear... with a zero bias unit.

The 2sc2510 and the MRF-422 are not FETS they are bipolar. As for
cost, yes they are more expensive. At Rf parts the mrf-422 cost
$39.00. The 2sc2879s cost about $17.00. However, are you really saving
money by using 2879's? Since the 28-volt devices are 150 watt instead
of 100 watt you don't need as many to accomplish your goal. Plus your
not popping the device by over voltage and what about the cost of the
power supply. At 28 volt your current is halved. I'm assuming it's a
linear supply and not a switcher. You don't need as big as of a
transformer and pass transistors.

Source record: 111149

Most tube units have low harmonics.
This comes mostly from the fact that most tube units have a high q tank circuit for the output.
Taking a wild guess... I would put the harmonic content at 40dBc for the second, and 45dBc for the third.

Unfortunately, most (if not all) wideband transistor amps are only 20dBc and 25dBc respectively. This can be a problem with operating such amps close to TV sets. So you see that if you operated one of these amplifiers at the 100W level, than you would be generating 1W very near to the VHF TV (second harmonic) band. This is certainly enough power to cause problems to nearby sensitive receivers.

Unless you have a test bench at home (some of us do) why would normal radio people have an SA just sitting around waiting for a dolt like you to suggest putting an amplifier on it? My suggestion would be to run the radio through it and clean up the source. GIGO still works in the fabulous 00's.

This item is a GE HELP- Model 3-5908A full-power 40-channel 2-way CB radio system. It is designed for automobile use. It is supplied with a cigarette lighter power adapter, magnetic-base antenna, and a rugged, hard-plastic carrying case. Quick, easy 3-step set-up. Use for emergencies or obtaining information. With a second CB, would be ideal for family or friends to stay in touch while traveling together in separate vehicles.
Super compact size
Stores easily in glove compartment or under car seat for emergencies or road information.
Full power, 4 watt, 40-channel transceiver
Magnetic-base, collapsible whip antenna with 10 ft. cord
Cigarette lighter power adapter with 5 ft. cord
PLL circuitry, electronic scanning
10-mm LED channel readout
Squelch control
Push-to-talk bar
Built-in condenser microphone
Automatic noise limiter
Built-in dynamic speaker
Rugged, hard plastic storage case
Transceiver dimensions: 7.5 x 3 x 1.75 in.
Case dimensions: 11 x 4.5 x 2.5 in.

No perhaps but what it will do is reduce the modulation percentage of the
waveform coming out by way of your beloved 'flywheel action'. Not that
75-80% is all that bad; the old Gooney Boxes beloved of VHF and 10 Meter
hams used Heising (choke) modulators and were incapable of more. Seemed
to work ok.

Hi, I have a nice set of drake twins. T4XB transmitter, R4A Receiver.
Have replaced the output and driver tubes in transmitter.New tubes. Both

units
have been algined by KG4H. Also have AC-4 power supply for
transmitter
new caps etc. in it, been rebuilt. Both units have had the blue filters
replaced on the vfo's and meters. the T4XB is orginal piant,
copper is nice.Face is really nice. The R4A has been repainted the
faceplate does show some paint fade dark grey area not as bright as it
was at new.no scratches or letters rubbed off,
copper need some cleaning. Have made up proper jumper cables
RG-174u,
not the cheap phono cabes. Also included is a Brand new Shure 450 Hi

Impedence desk mic. The R4A has the following extra crystals
12.5,13.0,29.1,36.6,37.6,38.1,39.1 in addition to the factory stock
10-80.
The T4XB has the following extra crystal 37.6 in addition to factory

stock 10-80. Full output on all bands since new tubes were put in the
transmitter. These units work really well together. All knobs are in

good shape feet also doubled up to give rise on front. These units are
ready to go on the air been using them nightly. work perfect. Been
out of work for a bit so need to sell some excess gear. asking 500.00 +
shipping.
OBO You won't be disapointed. will not separate sold as package deal

only.

Source record: 111160

Just changed my mobile antenna and have a good swr reading,1.1 to 1.3 around the band. The problem I'm having is that when I turn on the amp the radio is squeling and feeding back through my stereo speakers.I'm sure everything is grounded good including running #4 copper from the antenna mount to the chassis.I had a 102" steel whip on before changing and did not have this problem.I have tried 2 different antennas, a monkey made and a Dr. Crow and just can't figure out the problem.
Any ideas?????
Thanks
Hacksaw

Hello Dave: Yes I know what you mean, about the low power audio of the typical CB radio, in the PA mode.

We got a big junk yard here in the Mojave Desert, everything from old airlines to old cars, trucks, washing machines, and I mean everything.

I got a old Motorola Public Address System that is rated at 50 or 100 watts. The expensive thing is the Bull Horn Speaker, I got one off a old fire engine in the junk yard for 10 bucks, bitchen! Its Motorola's old high power version I believe.

This PA System is big time "ASSUME THE POSITION DIRT BALL" loud. Me and the kid drilled and tapped holes in the forward cross member frame of my 1966 Ford F250 4x4 Truck. The Bull Horn Speaker is mounted far enough back were ya can't see it, unless you get down and look under neth the truck. The Great thing is that the bull horn speaker is unobstructed, allowing for maxim loudness.

Its differently what you want to let Miss America driving her SUV thinking that the world revolves around her, while doing her nails, and informally paying attention to driving.

Its defintely not the automobile accessory that normal people should have. Ok for Cops, Firemen, Ambulance, and radio enthusiasts.

A bullet proof windshield might also be a support accessory.

Jay in the Mojave

Dave wrote:
>

If you just finished reading QST and have to ask where to write...DUH? Do you think you have any chance to pass a test? DUH..

HELLO!!!!!!!!!!!!!!!!! Maybe you can find who to write in QST....DUH... LOL...

Check the SWR between the radio and the amplifier and also recheck ALL your grounds. You might want to go wit a few ferrite beads along the speaker wire right at the input the speaker too.

LS454SS70 <ls454ss70@aol.com> wrote...
> I smacked my five pill at 24Volts for 10sec at a keydown it lived, worked
> well too. I won LOL
===

I think that John may be wanting more than 10 seconds use in one go. Many devices will take much more than their rated voltage or current for a short 10 sec burst.

===
> Bulls**t they are rated for Max 18volts Stupid.
===

This may depend upon the manufacturer, I have seen semiconductor spec change between manufacturers.
But it still doesn't do to run things at their max, when you can get something else that will do the job you want. Manufacturers usually know what their devices can do, and just one transistor breaking down and going c-b s/c could pop all the rest.

===
> I run my 5pill at 20volts
> everyday I've done so for the past 2 years with no problems.
===

A manufacturer I once worked for had problems with one of their products... They had designed the circuit specially for one customer, and had to get a batch out that night (or the order could have been cancelled). Unfortunately, 50% of the boards were failing test, but they had been made correctly.... and previously made boards had all worked fine.

As the only technical person willing to work all night until the batch was ready, I had the job of getting as many as possible to work so we were not left with too many extra units.
It turned out that the R&D chap had used a device running at it's max, and the latest batch of components could not cope. My problem was that component types could not be changed without the Tech. director agreeing, and he didn't work nights. So, I had to fiddle with a resistor value to mask the fault, that was allowed (yeeee-har... ride-em cowboy).
The design was later changed to use a better rated component, before the next crisis.

It may interest you to know that they soak tested certain completed products at above their rated voltage just to be sure they would stand a little abuse. They dropped them in angled holes behind me when testing. If one exploded, I had to duck... and quick.

===

Kinda reminds me of an antenna I saw in a catalogue some years back.

Ahh here it is "Pan International" catalogue (~1982)...

MS 119 Direction findinding antenna:
3-element-beam, which don't rotate, but select omni or
beam direction instantly with electronic desk. Gain 12 dB.
Cpl. with desk.
Order No. 11103
-

The above text is from the book, so don't ask me what it is 12dB better than.
It looks like 3 dipoles mounted on a single center mounting pole.

===

Sounds reasonable to me ;~)
Rather like the "fox hunts" that used to happen here in the 1980s. Loads of money spent on fuel just to chase after someone who was hiding somewhere. When someone found you, they hid, and y'all tracked them down.
The key was that if you were good at it, you was hiding, and not chasing.
Early on Sunday morning, the remaining hunters (who had not given up, and gone home) would all crash in (literally, as they were often asleep at the wheel) at the only cafe in the area to open on sundays.

Yeah, I miss those days.

===

> they be so easily returnable to full coverage tx?
===

Too right.

And why else would they be willing to fax details of how to convert their radios to transmit on CB frequencies. I have a copy of one such fax.

They build the features in, and if you ask, they will tell you how to enable them.
Rather like the "Nato 2000" UK CB that was made in the 1980s. The radio was a cybernet export radio with all illegal functions disabled so that it got the legal "CB 27/81" approval for the UK. It was simple to enable the other bands and modes, and I doubt if any of them are still legal.

Some of the 10 metre only "Ham radio" equipment is clearly designed for CB use. Not only are some of the main circuits standard CB circuits, identical to the uniden exports... but the frequency control circuits are designed with the CB frequencies available. You simply have to enable them, the radio may even be ready tuned for all the bands.
Check the service manuals for the 10 metre radios, adjustments that should be made at centre freq. are made at 28MHz... adjusting for 26 - 30MHz.

Let's face it, the manufacturers are in on it.
The CBers are providing quite a few extra sales for the ham radio manufacturers. Even when buying second-hand, they then make it possible for the old owners to keep buying new equipment.

So that means that the Hams must be selling their old equipment to CBers... so they are in on it too.

Brainbuster.

For neither they themselves who are circumcised keep the law;
but desire to have you circumcised, that they may glory in your flesh.

Thanks SD... I never got the original post, it must have been from a blocked
troll.

I notice that in september, a certain troll stopped changing his "nic"
for a while, and made it to the top!!!!!
By October he was back to changing names, and dropped to the middle of the
top 10.... with just one of his identities.
Now, what if all his screen nics were counted as one person for every month,
the figures could be very different.

Hey, I made it into the top 10 in October !!!?

In Never-Never Land all things are possible except growing up.

Perhaps in your area, the bottlers brought out talking Coke machines some years ago to great fanfare. Then they noted they were doing a lot of funny maintenance tasks including bullet holes, dents from large bumpers on large vehicles, etc. People do not really enjoy talk like that. I have seen people flip off elevators that tell them to get out of the door as they struggle to get kids, packages, coffee carts, etc. off. Pure frustration.

There were some car alarms that talked. When told he was too close to a car, a well-dressed older gentleman simply walked up and kicked the door in. Seemed like a good idea at the time so call me Sgt Schultz.

If this cat has the suppressed anger to complain at someone getting out of a car in a lot, a severe beating by a large boyfriend/bodyguard and a raft of broken glass is among the milder reactions he should expect.

Message-ID: <b4f86a9c.0201052013.3ee7d553@posting.google.com>
Source record: 111049

This summer when I was lugging the push mower around the neighborhood (I get 25 cents per lawn) I thought I saw a car go by with a guy in it that stared at me. Since I am a small-boned person and I have to be careful I don't get in fights, so naturally it concerned me.

I shot my mouth off in the newsgroup and may have said some stuff just kidding around trying to act big. Sparky said he'd meet me at Arby's but I got scared that he'd be angry so I went out and hid under a bus bench until after dark.

When I got home there was a message (my Mom took it) that he was in town. I couldn't sleep all that night. Fortunately I was able to duck him for the next 3 days. Now months later I am having nightmares about him giving me a good talking to and me not being able to do nothing about it.

So any of the big strappers in here could help me out I'd appreciate it. Let;s get the old rrcb gang back, Toll, Train, Dennis and maybe we can get rid of all the flack in here.

It's winter and there's NO BUSINESS here (lawns don't need mowing) so I am sitting with my thumb up my ass collecting unemployment and just waiting for something to do.

I thought about talking tough on the newsgroup but look what happened the last time I did that : (jesus I almost got beat up bad. It was my fault I was drunk on kaopectate and made some careless remarks.

So I figured I'd ask my friends on the NG for ideas about what to do now. Should I go to Beauty School? Licensed beauticians make $5.90 an hour so it's atractive. Also I get to dress cool and be around ladies instead of smelly men.

Dick is the oldest here so I will defer to his judgement.

The only steel tubes I am familiar is with the lawn care business.
Once I was working for mean old Mr. Barclay over on Chesterton Avenue
and he was complaining I wasn't cutting his lawn fast enough.

That did it. Next time he went in the house I snuck around back behind
the hedges where there is a metal downspout coming off the roof. It
was about waist high and is a tube made of steel. I put my pecker in
it and was jacking off and about to shoot a load when around corner
comes Old Man Barclay.

Well I tried to pull out but got stuck and Barclay gave me holy hell
when he caught sight of me with my member jammed into that tube and
not being able to get free.

I guess we are not talking about the same thing but that's what it
reminded me of anyhow.

Why stop at one 600w fet?

From a design point of view, It makes more sense to use two or four
600-watt transistors than 12 or 24 2sc2879's and the 50-volt power
supply is even more manageable.

> Any ideas?????

We need more information. Where are you measuring the SWR? What is the
SWR when the amp is operating?

Now, a guess:

Such squeals are often due to rf currents on the outside of the coax.
It may be that your new antenna system is generating such currents, where
they weren't happening with the long length whip. This is often the case
when using a magnetic mount antenna.

The only steel tubes I am familiar is with the lawn care business.
Once I was working for mean old Mr. Barclay over on Chesterton Avenue
and he was complaining I wasn't cutting his lawn fast enough.

That did it. Next time he went in the house I snuck around back behind
the hedges where there is a metal downspout coming off the roof. It
was about waist high and is a tube made of steel. I put my pecker in
it and was jacking off and about to shoot a load when around corner
comes Old Man Barclay.

Well I tried to pull out but got stuck and Barclay gave me holy hell
when he caught sight of me with my member jammed into that tube and
not being able to get free.

I guess we are not talking about the same thing but that's what it
reminded me of anyhow.

I wish they'd stop calling me peepeeholic.

I wish Sparky would not be mad at me.

I wish I could cuss like Toll and Train (my heroes).

I wish I had a big radio so I would feel big myself.

I wish I had a small animal like a hamster some nights.

I wish my lawn mowing business made more money.

I wish I was brave enough to tell Landshark to stop touching me.

I wish my hobby wasn't illegal.

Be nice Dicky, "U" too will age. I am tolerable and pretty and i'm 62.

And this really has nothing to do with amateur radio policy so it's gone.

Why piss off people when it's not necessary.

Wasn't dwight stewart the guy who was causing all the trouble in this NG, Or was it Doug Adair?, or was it leland Scott? or was it Aaron Voobner? or was it yrac? or was it kari? or was it George? or was it Sparky? each and every one has been blamed for being the culprit who advocateds legal CB and is against the keyclowns.
So tell me who will it be next ? They posted sparkys telephone number they posted dougs, they forged leland, sd jones even went as far as threatening to send someone to shut these people up. Maybe old Mark Beck can answer some questions for us, we may have to travel to Freemonte CA to get the answers but who knows perhaps he is willing to share some info why it was ok to blame all these people and continue to blame innocent people daily. Of course with no proof or justification. If my name and call sign is continued to be brought up in this fashion defaming and slandering my good name with false accusations of which can be proven not to be me, a lawsuit may follow. I am putting the NG on notice cease and desist with the false accusations, unfounded complaints to ISP's etc, otherwise legal action may follow. I am sure you guys will try to have fun with this, that is your peragative. I will have the last laugh if it keeps up. Lets see who is gonna be first. Do some research on the net if you think I am full of shit with this.

Hello John: I year or so ago I bought the "Starduster" copy.

What a out and out marvel of engineering wonder that produced a cheap, monkey shit pile. Every part, piece and tubing was the cheapest piece of shit available to man kind. After assembling the base assembly, it rattled, and had a intermittent electrical connection.

A neighbor kid wanted a antenna for CB and shortwave listing. I rebuilt a old Hy-Gain CLR-II, removing the cheap impedance matching coil in the bottom insulator, and modifying the CLR-II with a external tubing type impedance matching device. Just so the kid would not have to use that cheap, communist, pile of monkey shit, copy of the Starduster..... Which I later thru out into the scrap aluminium barrel!

If you made the Starduster from old kitchen broom handles and black tape, it would be built better.

Suggest you look around the populated areas, you may just run into a old for gotton Starduster that the people want to give it away. Or you can make one, easy to tune. Just adjust all the elements for the lowest SWR.

Jay in the Mojave

Yes I agree, sounds like the speaker wiring is picking up the RF Energy,
and its getting back into the stereo. Using the ferrite cores available
from Radio Shack, and wrapping the speaker wires neat to the stereo unit
may cure the interference problem.

Tune the antenna with the meter as close in line to the antenna as possible. You also need to check SWR between the radio and the amp. If the match there is off (my bet is that it is) you'll need to put a matcher in line there or have the radio and amp "matched". This will give you the most output and audio from both units as a bad match there is not a good thing. The match between the amp and the antenna should be good also and if not adjust antenna for a better match. A matcher in this part of the setup would work but at the expense of watts.

Bruce the meter should be the last thing inline before the antenna. Notice,
how i didn't say to tune it after the amp since amps are illegal in the USA
on the CB band.

928. Ok, I need the expert opinion of all you radio'ers out there...

Newsgroup: rec.radio.cb

Source record: 111215

I need someone's opinion because, I am about ready to make a purchase and I want to make sure I am making a good decision. I have a Northstar 9000 radio which has all the extra channels, the radio has been scoped, etc. I have a Wilson 1000 trunk lip mount for my antenna that is put on a 1994 Chrysler Concorde. I was recently considering buying a amp and I was told the Texas Star 350HDV would be my best choice. Considering, I have a top of the line battery but only a 90 amp alternator, I am limited on my amp draw. The radio pulls about 7.5 amps and the Texas Star 350HDV pulls around 30 amps. With that in mind I need you guys' opinion on how good you think this setup would be i.e. would it be good for dx'ing?, What do you think my average range would be outside of cleveland ohio where I live?, Is there anything you'd recommend changing about my system given that I only have the 90 amp alternator? Is the Texas Star 350HDV the best amp for my money? And any other comments you might have about my setup.

I do use both AM and SSB so I do need an SSB delay in my amp. Thanks in Advance!

you win the first tall pointy hat award of the year from rec.radio.cb congrats on your honor!!! your thinking is flawed because you understand zero about amplifiers. are you saying that if i take my old heathkit that did have ten meters on the bandswitch and retune the input circuit to 11 meters that somehow the amp is now a hideous monster and no longer quality stuff? what about all the hf amps that have been converted to 6 meters? i guess those guys are a major source of trouble too. is it beyond your comprehension to understand that there is no difference between 27 megs and 28 megs other than a treaty from the ITU. there is no magical line between the two that makes a radio work differently on one side of the 28 line than it would on the other side. do you have a problem with all the guys running ft-101's on cb even though they were designed with 11 meters in mind?

I should have been more clear, the dumb part is about the amp
being run on 11 meters and having harmful spurious emissions and
harmonics. It won't have any more spurious emissions or harmonics
there than when run on 10 meters.

Tim I again ask you do have some type of proof other than your opinion
right?

> some were just a bit more creative than others. you gave us your name
> george.

I did? Where did I say my name is george busch? Or is this another
assumption/wild claim on you guys part? just like sparkys phone number that
wasn't sparkys.

> you told on yourself and now your mad because we know who you are?

You do? I did?

very
> funny. its not so fun anymore when you cant be anonymous is it?

Tim, If I gave you my name did I want to remain anon? Or did I not give you
my name?

>wheres your back bone george?

It is where it always has Tim right above my asshole, would you like to see
it? You seem to like ass.

>your threatning this group with legal action scares who?

Tim, I am threatinging anyone that is for guys like SD jones etc, but who
ever want's to continue the lies will care right?

> not me.

Who cares?

> the aforementioned people including you are all members of the
> "AntiKeyClowns"

Are we Did? I show you my card or did you check the AKC register?

> which is a self apointed faction that is dedicated to disrupting this
newsgroup.

No the AKC are advocates of legal CB, You and your type see this as a disruption of your Illegal CB behavior. They are dirupting your right to be illegal right? Is that what makes you mad? What do you call your faction?

> now that you've seen it did not work and we are not leaving and that some of the unscruplulous >within us are willing to give tit for tat your running scared.

What has not worked Tim? and who wants you to leave? Isn't Landshark advocating complaints to ISP's. Seems you guys want anyone against Illegal CB to leave more than they want you and your gang to leave. You and your bunch are trying to silence critics of Illegal Op's. Why? So at least you admit that you guys have forged people and used unscruplulous tactics. If this is true then why cry about the AKC when you guys are just as bad.

> whats the trouble george busch? cat out of the bag

No Tim Nebout, is the cat out of the bag? who Is George Busch? Isnt he the president?

> and now your getting scratched? sorry for you but you are the guys that started
> and continue to perpetuate it all.

perpetuate what Tim? who perpetuated the forges of Leland, dwight, sparky, aaron and me? Why is it ok for you and your group to do it? when someone else does it you don't like it and cry and complain Forge this forge that. How about a reasonable answer.

And you changed your e-mail in your header again
just to make sure he sees your post.
You really do need the attention and to stay off the
"top posters" position so you can claim to have a life.

Another entry for my killfile.
Go (_x_)

Mr Two Fingers.

944. how to clean up this n/g

Newsgroup: rec.radio.cb
Date: 2002-01-06 17:45:39 UTC
From: Karl <karljb@earthlink.net>
Message-ID: <730_7.7924$zw3.962197@newsread1.prod.itd.earthlink.net>
Source record: 111230

hey I found a great way to clean up this news group. I use Microsoft outlook express 6. it has a function called (block sender) you go to message drop down after you highlight the message, click on block sender. it blocks that sender and you don't have to here that troll's stuff anymore. I figure if they don't get any response's from us they will go away. mad I hope. try it! you'll like it!

Yes Tim, Landwhale now thanks anyone who quotes my posts so he can claim not to read them on his own. But If he quotes what I say then why am I killfiled? Just another hypocritical twist from Mark Beck. Mr.Beck, where did I say you complained about forges to my ISP, huh mark reread the post OI know you have probably read it a few times anyway. Your complaints also fell on deaf ears since it is not a aup violation asshole.

A NOTE TO THOSE WHO ONLY “READ” AMATEUR RADIO NEWSLINE(tm)

For those of you who only know of the Amateur Radio Newsline (tm) as a text newsletter we would like to invite you to listen to the audio version. This Amateur Radio Newsline (tm) script is actually written for the “spoken word.” It is recorded each by professional broadcasters and is available for private listening or rebroadcast over your repeater. Three methods of delivery are available: Streaming audio using RealAudio, FTP RealAudio, FTP MP3 or dial-in telephone. Please visit our website at http://www.arnewsline.org for a list of telephone numbers (you have to pay your own long distance charges) and links to audio servers providing our voice newscast. On site free FTP Downloads are available at our site by clicking on the newscast number at the top of the page.

HAM RADIO TESTING REACHES WHITE MOUNTAIN ALASKA

Ham radio examinations have finally come to one of the remotest areas of the nation. This, after a team of examiners from the W5YI VEC perform a fly-in examination session in White Mountain Alaska. Amateur Radio Newsline’s Norm Seeley, KI7UP, has the details:

--

White Mountain is a remote fishing village in the far North-West of Alaska. It’s major claim to fame is that its the next to the last checkpoint for the famed Iditarod dog sled race. And it wanted someone to come in and give ham

radio exams.

The closest big city is Nome. White Mountain is only about sixty miles from Nome but its over some rather treacherous terrain. There are no roads in or out and all supplies to White Mountain have to be delivered by plane or boat.

But White Mountain does ham a ham radio operator for its mayor. He is reindeer farmer Tom Gray KL0CQ. And one of its school board members is Eric Morris KL7HT. Both will tell you that a temperature of minus 40 degrees Fahrenheit and a wind-chill factor of minus 100 degrees is not uncommon in winter. These were the conditions faced by a four member W5YI VEC test team when it chartered a plane and flew in on December 11th to administer exams to four adults and fourteen youngsters who were determined to make ham radio a part of their life.

The trip which cost $800 for the flight alone was sponsored by the Seward Peninsula Amateur Radio Club. Braving the weather were examiners Ramon Gandia AL7X, Michael Nurse KL7UJ, Scott Webber AL7RJ and Thomas Busch NL7H. Al four are from Nome. Most of those to be tested came from the Bearing Strait School District’s only inland school. They had all been studying for their Amateur license as part of a search and rescue course. Neither the applicant or the VE team were disappointed. All eighteen passed the Technician class exam.

For the Amateur Radio Newsline, I’m Norm Seeley, KI7UP.

--

Those involved in ham radio testing are keenly aware of the problems faced by remote areas of Alaska. At last July’s VEC Conference in Gettysburg Pennsylvania Jim Wiley KL7CC told the group that many applicants in Alaska are denied n Amateur Radio license exam due to the inaccessibility of their locations or the high cost of travel in that state. (W5YI)

HAM RADIO AND THE LAW: FCC SAYS NO ON PRB-1 EXPANSION REQUEST

Ham radio has lost yet another battle against deed restrictions, but the war is not over yet. At least that’s what the ARRL appears to be saying in a bulletin that describes the latest skirmish with the FCC over this politically volatile issue.

In the latest round, the FCC has affirmed a November 2000 staff-level decision that declined to include privately imposed deed covenants, conditions and restrictions under the limited federal preemption known as PRB-1. That’s the federal government policy requires municipalities to ''reasonably accommodate'' amateur communication in antenna-related zoning and regulation.

The ARRL last year appealed to have the full FCC review the earlier denial. The Commission turned down the League's Application for Review December 18 in a Memorandum Opinion and Order released December 26. As a result, it now looks as if the ARRL will bypass any further dealings on this issue with the FCC and will look for congressional relief instead.

The FCC itself even hinted that Congressional action by the ham community might be a next logical step. Its memorandum, opinion and order of dismissal did note that if Congress were to see fit to enact a statutory directive mandating the expansion of the FCC’s reasonable accommodation policy that the Commission would expeditiously act to fulfill its obligation there under. Translated: If Congress tells the FCC to include deed restrictions under the provisions of PRB-1, it will be more than happy to do so. (ARRL)

**

HAM RADIO IN SPACE: PROJECT JJ - HE EAGLE HAS LANDED

AMSAT-NA's newest satellite project, known as Project JJ for the past year, now has a new and official name. This, as AMSAT North America President Robin Haighton, VE3FRH, announces that effective January 1, 2002, the satellite will officially be known as 'Eagle'.

The name Eagle was submitted by Bill Allen, W7US, of Tucson, Arizona. It was selected from a list of forty-five names submitted by twenty-nine satellite operators.

For his winning suggestion, W7US will receive a free dinner at the annual AMSAT dinner held during the Dayton Hamvention. We will have more ham radio space related news later on in this weeks Amateur Radio Newsline report. (AMSAT-NA, ANS)

**

BREAK 1

Welcoming in the new year with ham radio news coming to you from the United States of America. We are the Amateur Radio Newsline, heard on bulletin stations around the world, including the N7VGS repeater serving the Salt River Star Valley Wyoming and congratulating 13 year old Devin Cassity, on becoming the youngest ham in South West Wyoming. Devin is now KD7PHN.

EMERGENCY PREPAREDNESS: NORTHERN CAL TOWN CHOOSES HAM RADIO

Ham radio started the year with some very positive public exposure in the Los Angeles Times. The January 1st edition featured an in depth article about a Northern California town that will tap into older technology to prepare for future emergencies.

Worried that a disaster will knock out e-mail and cell phones, Los Altos Hills has decided to turn to its local ham radio community and make it the primary back-up to normal disaster preparedness communications. And as you might expect, the hams are more than ready to oblige

The complete story can be read at the Los Angeles Times website. The complex URL is http://www.latimes.com/news/local/la-000000203jan01.story. (Highlighted by ARNewsline™)

**

AMERICA AT WAR: POPCOMM COLUMNISTS SAYS “DONT TURN THE OTHER CHEEK”

Popular Communications writer Eric Force has some strong words that are obviously aimed at the pacifists who oppose the United States military retaliation against Osuma bin Laden and his al-Quida terrorist network. As a response to those he calls the “do-gooders of the world” who promote turning the other cheek, Force says to look, really look at the attack that brought down New York City’s World Trade Center twin towers. He then says that it could have struck a lot closer to them.

Force says and we quote: “Consider that it could have been you, your mom, dad, brother, sister other relative or a close friend in those planes and buildings who were terrorized, murdered and buried in the rubble.” He adds that just thinking about the incomprehensible terror, suffering and losses incurred by innocent human beings a the cowardly hands of international thugs continues to tear at his heart.

Force has dedicated his latest I-Waves column to the sights and sounds of September 11th that are available on the Internet and to the victims of the tragedy. Its a very compelling article. You can find it starting on page 66 of the January edition of Popular Communications Magazine that’s on newsstands right now. (PopComm)

**

AMERICA AT WAR: FEDS TO AID NYC TV STATION REBUILD

New York television stations will be getting federal help rebuilding transmitters that were destroyed in the September 11th terrorist attack on the World Trade Center. A total of ten New York area stations will receive eight point two million to offset the thirty million to forty million dollar price tag for purchasing and
constructing a new transmission facility.

According to the Broadcasting and Cable newsletter, Senator Charles Schumer managed to secure the funding as addition to emergency aid appropriation for victims of the attacks. As previously reported, there is some speculation that the replacement transmitting facility could be a 1500 to 2000 foot high stand-alone tower constructed near the former site of the Twin Towers. (Broadcasting & Cable)

**

ENFORCEMENT: NAL CANCELED

The FCC has canceled a proposed ten thousand dollar fine that it had issued to Jeffrey Alan Pettrey, This, for his apparent violation of Section 301 of the Communications Act involving operation of an unlicensed radio transmitter.

Back on July 30, 2001, the District Director of the Commission's Columbia, Maryland Field Office issued a Notice of Apparent Liability for Forfeiture in the amount of $10,000 to Pettrey for the infraction. Pettrey filed a response to the N-A-L on August 7, 2001 accompanied by documentation regarding his

inability to pay the proposed fine. After reviewing Pettrey's response, the FCC conclude that cancellation of the proposed $10,000 forfeiture is warranted based on Pettrey’s inability to pay. (FCC)

**

ENFORCEMENT: FCC CANCELS CONVICTED HAMS LICENSE

The FCC has canceled the Amateur license of Kenneth P. Kelly, WT2FBI, of Greensboro North Carolina after Kelly failed to show up for a re-examination. But at the time of the FCC retest order Kelly was otherwise occupied. He was fighting criminal charges in relation to a jamming case in Ohio. We have this report:

--
On November 30, 2001, Kenneth Kelly, the ex-WT2FBI was sentenced to 5 years probation by the Judge H. J. Bressler in a Butler County Ohio court. He had previously been indicted on a 4 th degree felony charge of disrupting public service by his jamming and talking on the Middletown Ohio police radio system.

At his hearing, Kelly agreed to a plea bargain. He admitted his guilt to a reduced charge attempted disrupting public services. At the time the FCC pulled his ham radio ticket Kelly was being held in the Butler County Ohio Jail pending sentencing.

By way of background, a person later proven to be Kelly was first noticed on the Middletown police radio channel the third week of July 2001. Initially the police dispatch radio system was not recording him but that was soon remedied by city radio technicians. After several days of taping, it was observed that the voice on the police radio was similar to one heard on the local 2 meter Amateur frequencies.

Several members of the Dial Radio Club then assisted police by monitoring and taping Kelly on the 2 meter band. Tapes from 2 meters and from the police were then voice printed the aid of computers to check similarities. Dial club members also tried to direction find and locate the signal both on 2 meters and on the police channel.

Through some luck, detectives working with a metro housing police officer and discovered that Kelly was now living in their jurisdiction. After they interviewed him, they felt that he was the person interfering. As the investigation progressed, he admitted to detectives that he may have accidentally transmitted on their frequency by accident. He claimed that his signal may have been mixing with an FM broadcast station and another ham repeater.

But Police did not believe it was accidental, because he was taped trying to talk directly to the police dispatcher and the cars. Later Kelly did admit his guilt and entered into the plea bargain. Now sentence has been passed by both the local court and the FCC.

For the Amateur Radio Newsline, I’m Burt Hicks, WB6MQV, reporting.

--

When he was finally caught Kelly had a Yaesu VX-5 hand held in his possession that had been modified to transmit out of band. The assistance of the Dial Radio Club members is credited with helping to solve this case.

Note: Information and documents from the case can be obtained from the Butler County Ohio Clerk's office or online at: http://www.butlercountyclerk.org/ Click on Butler County Court Records Search. Then enter Kenneth Kelly. (FCC, Dial ARC, others)

**

ENFORCEMENT: MITNICK TO FIGHT TO KEEP HIS HAM LICENSE

Another ham who appears to be getting ready to do battle with the FCC is former computer hacker turned talk show host Kevin David Mitnick, N6NHG. Amateur Radio Newsline’s Bill Pasternak, WA6ITF has the latest:

--

As reported last week, the FCC is challenging Kevin David Mitnick's request to renew his ham radio license. The agency claims that his criminal background raises a substantial and material question of fact as to whether Mitnick possesses the requisite character qualifications to be and remain a commission licensee.

Now, N6NHG has told the U-K Newspaper the Register: "It's just another example of them trying to harass me. Now I've got to spend money to keep a ham license."

Mitnick insists that he has totally abandoned his former ways. The Register article notes that that he was recently called to testify before Congress on federal computer security matters. Also that he spent two days briefing the U-S Commission on National Security on these issues. Mitnick tells the Register that he cannot understand why the government is now questioning his character.

Mitnick is currently the host of the radio program called The Dark Side of the Internet. It airs in the Los Angeles area from 5 to 7 a.m. Sunday mornings over radio station KFI 640 AM. And in a recent appearance on Coast to Coast A-M hosted by Art Bell, W6OBB, Mitnick said that he is hoping for a career in computer security once his term of supervised release from prison has been completed.

For the Amateur Radio Newsline, I’m Bill Pasternak, WA6ITF.

--

The complete Register story and interview with Mitnick is on the web at a rather long and complex U-R-L. You will find it at http://www.theregister.co.uk/content/55/23494.html (Adapted from the Register)

**

INTERNET SECURITY: CIA GOES OUT OF ENCRYPTION COMPANY FUNDING

And speaking of Internet security, word that a Central Intelligence Agency funded company that allowed Web surfers to browse anonymously has closed. According to news reports, Emeryville California based SafeWeb enabled Internet users to gain access to the World Wide Web and browse sites through its encrypted service. This made their on-line habits and history untraceable. In the 2000 - 2001 fiscal year, SafeWeb received one million dollars in funding from the U-S Central Intelligence Agency's venture capital arm. (published reports)

**

HAM RADIO BUSINESS: AMATEUR RADIO TRADER CEASES PUBLICATION

Ham radio Internet auction sites may be responsible for a twice a month ham radio equipment sales magazine going away. This, after Amateur Radio Trader magazine announces that it has ceased publication.

According to Editor Barbara Patterson, KF4MMV, the Amateur Radio Trader was no longer a viable product. She says that the firm will be redirecting its resources into other areas.

Meantime, the company has also pulled its amateuradiotrader.com website off line. But unlike other publications which have gone under, in this case subscribers are being reimbursed for any outstanding issues. In addition to handling buy and sell ads, Amateur Radio Trader also donated page space to advertising the annual Newsline Young Ham of the Year award. (ARNewsline™)

**

HAM RADIO HERITAGE: MAKING WCC A PART OF THE FUTURE

A ham is campaigning to preserve part of radios past and have it become a part of the future. This as Lewis Masson, K1LJ-S, says that the town of Chatham Massachusetts should convert the site of radio station WCC into an Amateur Radio station along with a training curriculum to teach the kids in the area about communications technology.

WCC is one of the original Marconi Marine Radio Stations. Masson is an ex-marine telex operator at WCC. The site was recently turned over to the town of Chatham and Masson believes it is important to preserve the operations building as an operating amateur radio station and keep the hotel building as a museum to preserve and display memorabilia.

Masson says over the Internet that he has formed a committee to work on this project and that they are looking for nationwide support for this campaign. If preserving the past as an investment in the future is of interest to you, please contact K1LJS by e-mail to lemasson@juno.com. (Internet)

**

SPECIAL EVENTS: HAM RADIO UNIVERSITY 2002

A reminder the third annual Ham Radio University event takes place on January 20, 2002. Location is the Babylon Long Island New York Town Hall Annex with the doors opening at 9 a-m Eastern time.

Ham Radio University is a day of education about Amateur Radio. This there will be twenty, one-hour presentations with special forums geared to the non-ham as well as the experienced Amateur Radio operator. The focus will be "hands on" with many demonstrations. Besides the forums, there will be tables set up with information about the different groups, ham radio classes, exam session schedules, public service and other activities.

For more information about Ham Radio University, please contact its Chairman Phil Lewis N2MUN by e-mail to n2mun@optonline.net. You can also get in touch with ARRL New York and Long Island Section Manager, George Tranos N2GA by e-mail to n2ga@arrl.org. Also check the Ham Radio University website for a full list of forums, directions and talk-in information. Its in cyberspace at www.arrlhudson.org/nli/hru2002.htm (N2DO)

**

HAM RADIO RECORDS: BEST OF THE WEST AND VHF CONTEST HONOR ROLLS

Tim Marek, K7XC, says that he has updated W6 / W7 & "Best In The West" VHF Contest Honor Rolls. They are now available at the following web sites.

http://k7xc.tripod.com/VHF_Records/index.html s the stand alone records page. http://k7xc.tripod.com/K7XCweaksignal/ is where individual links can be found to each contest. (VHF Reflector)

**

HAM RADIO SCIENCE: NEW 6 METER PROPAGATION BEACON IN WASHINGTON STATE

Rich Ewing, KO7N reports over the VHF Reflector that Bruce Shurtz, W7BAS, has installed a propagation beacon in gridsquare CN87TG near Kennmore Washington. It operates on 50.069 MHz putting out 10 watts to a 5 element yagi pointing 90 degrees. The beacon is operational 24 hours a day, seven days a week. QSN reports go to W7BAS, at his callbook address. (VHF Reflector)

**

HAM RADIO IN SPACE: VERY FEW LAUNCHES

Peter Guezlow, DB2OS, reported that 2001 has turned out to be the slowest year for space launches in nearly 40 years. Ham radio or otherwise. According to DB2OS, only 58 flights reached orbit, and there was one complete failure.

Guezlow says that historians note that we must look back to 1963 to find a year that produced fewer launches. He says that in 2000 there were 82 launches to orbit plus three failures. By contrast the most productive year was 1984 when 129 launches delivered payloads into orbit.

But there is at least one bright note. Russia successfully placed five satellites into orbit recently after launching them aboard a Zenit rocket. The cargo rocket, carrying three Russian, one Moroccan and one Pakistani satellite, took off from the Baikonur space center in Kazakhstan. (AMSAT, ANS)

**

HAM RADIO IN SPACE: NEW INDIA WEBSITE

The AMSAT-India website has been officially launched recently by the government of India and the Department of Space. VU2POP says that you can check it out by taking your browser over to www.amsatindia.org. (ANS)

**

CONTESTS: HUNTING LIONS ON THE AIR

The 31st annual Hunting Lions in the Air contest will take place on the weekend January 12th to the 13th. The contest period will be 48 hours and will run from midnight UTC Friday night to midnight UTC Sunday night, and all hams are welcome to participate.

According to its sponsors, the objective of this operating event is to create and foster a spirit of international understanding and cooperation among radio amateurs and members of the Lions Clubs through the use of world-wide radio communication. The contest also commemorates the birthday of Melvin Jones, the founder of the Association of Lions Clubs who was born at Ft. Thomas, Arizona on January 13, 1879. (Q-News)

**

DX

In DX, word that the recently postponed Ducie Island Dxpedition is on again for March. Ducie Island became a DXCC entity last November and it immediately jumped to the top of the most wanted contact list. But rough seas scuttle the first attempt to put it on the air. (RSGB)

Meantime 6 meters continues to be the V-H-F D-X band of choice. On Monday December 31st, Kevin Bishop WB8XX, says that he started hearing O-H-1-X-T at 1300 U-T-C on a backscatter path. From then on until 1620 U-T-C he worked 8 new countries and over thirty new grids in Europe and Asia. (VHF Reflector)

**

STRANGE TECHNOLOGY: ARE CELLPHONES KILLING GHOSTS?

Now, from radio communications to the effect of radio communications on supernatural communications. This, as a British expert who has spent years researching the occult says that cellular and other mobile phones are killing off ghosts. Don Wilbanks KC5MFA has the details:

--

No, we are not kidding you. In fact, Tony Cornell, of the Society for Psychical Research, has told the London Sunday Express that reports of ghost

sightings started to decline when mobile phones were introduced 15 years ago.

According to Cornell, ghost sightings had remained consistent for centuries. In fact, until three years ago the society received one or two new ghost sighting reports every week. But with the introduction of mobile phones 15 years ago, ghost sightings began to decline to the point where they are not receiving any.

And why are there no longer any ghosts being observed? Apparently paranormal events, which many scientists attribute to unusual electrical activity, my be drowned out by the electronic noise produced by cellular telephones and text messaging pager transmitters. And according to the newspaper, the lack of ghost sightings could adversely impact on the nations economy. It says that haunted tourist attractions in Britain could be under threat if the number of cellphones continues to grow from the present figure of about 39 million now in use in the U-K.

Don Wilbanks, KC5MFA.

--

And all of this begs that one question be asked. If ghosts are the spirits of the dead, how can anything actually kill them? (Science Today)

Tim,

Snip
>A. Multiple 3phase feeds, from each stator (the Electrodyne alternator of
>choice is a single rotor, dual stator alternator, supplying nearly 600 amps
>for each stator, peak).
>B. Multiple alternators (on the average of 4 to 12 per vehicle)
>C. NOS injected motors, big blocks or small blocks
>D. Multiple drive pulleys, using 6 to 8 cog serpentine systems.
The E-350 Electrodyne is their highest output alternator. Rated at 350A
@ 14v but the president of the company told me via e-mail that you can
squeeze 385A out @ 5000rpm.

Toll Has mentioned in the past that you can 'over run' these alternators
for even higher output however I've never seen this documented but I'll
take his word for it.

However, I think you're pushing it at 600 per stator.

My new unit in it's box is still here in the shack.

I'm enjoying the number flying.

I've seen bluegill's mobile with perportedly dual 4CX20K's but he, like
most AC op's are kind of cagey when it comes to onlookers.

Train,

>Your mistake is that Electrodyne's are AC not DC. You assume the voltage to
>be at 13.8 and this is not even close to the voltage being used!
>Go back to the board and run the numbers again.
You'll find his AC alternators are considered 'specials' even by the
factiry. However they market them, to you guys are 'AC Powerheads'.

When I ordered mine I said I don't care what it costs I want the highest
output AC alternator that you make and don't give me none of those Micky
Mouse Leeces:-)

The E-350 is it.

Phil / UK

The rule of electronics is that the AC waveform peak voltage is doube the DC plate / collector voltage.

Therefore, running at 24 volts shows almost 48 volts peak on the junction.

This below definately goes under the 6th plank! It proves govt. control of TV. Not only does their call letters prove it, but if they give them $$$$, then they are a govt. entity! The fed. govt. sponsors SMUT & trash & propaganda on 52-890 mc VIDEO !!!!!! Long live TVI !!!!!!!!! Dave!!!!!!!!!!!!!!!!!!!!!!!!!!!!

981. "in this age of loud CB's,...."

Newsgroup: rec.radio.cb
Date: 2002-01-06 21:09:22 UTC
From: Dave or Debby <truth@planetc.com>
Message-ID: <3c38bfe3@news.planetc.com>
Source record: 111266

I wish I would of kept the instruction sheet when I put in a Dixie "song" toy in last night, to quote it exactly. On it it said something to the effect of: "In this age of over loud radios, we put a volume control on it so you can turn it down with a loud CB."--or something to that effect. Well the pot in it was the wrong one, because in a not so loud, or not overly loud CB, I had it set almost all the way to the end of it's range to turn it down, so output volume would be OK. So if a CB was louder yet, it would be even harder to set. I think they were made in KY. Anyone else know what I'm talking about?
Dave!

Articles about "freeband DX or ... mods to get 25 to 32 MHz ...."

Oh, you mean those things which are ILLEGAL? Why do you expect such things to
be even recognized, let alone in other than a negative light?

Perhaps there's your problem....

Dick, I see you have fit right in with the CB Band Of Hypocrites, your blaming a guy for something he didn't do here is the header of the original poster and the guy who you accuse of replying to himself. Think before you speak Dick, you have guys sticking up for you behind the scenes but if you keep this type of idiocy up I think you will loose all support from them. Since you have been labeled as head Keyclown Cheerleader. If you do reply make it understandable not a twistedhed type Rant.

Whoever you are, I am not sure, and don't really care. But I thought you'd be interested in that the post you replied to was someone forging Tim. While Tim and I do not exactly agree regarding the whole radio/legaility issue, I do not think people should get jumped on for something they didn't say or do.

T, the amp is not good for 11 meter use in the USA according to our FCC Commission being from Canada I am not sure If you knew this so please do not try and sell this to anyone in the USA. There are strict federal laws re: Importing Illegal Items into the USA, as well . If you get caught that is.

999. tech talk, regarding antennas for base station.

Newsgroup: rec.radio.cb
Date: 2002-01-06 22:59:59 UTC
From: WebDoc REACT Unit #602 <arcweb@bnnorth.net>
Message-ID: <gE4_7.892$Mt5.53922@cletus.bright.net>
Source record: 111284

Ok I was sitting here reading over some material on antenna design, and I had an idea. Scarey thought yes.

Ok here goes, I was looking at high gain antenna arrays for VHF/UHF, and started thinking, would something like this be possible / plausible for 11m. How much area would be needed, and how would this change the radiated signal, as well as the incoming signal.

Keith, the post I replied to was from Scott, he didn't say his name was Tim, I am also not looking to start anything with you It's just that things get quite confusing. A guy named Landshark was forging me in the NG, LOL the dumbass posted to alt.test with his ip intact then tried to forge me in this NG. Until he was caught. Now they like to blame a guy named George? And accuse him of many things, hey stick around you may too get the Finger pointed at you(no pun intended), I have a good idea of who is doing it but I won't be like them and accuse people without actual proof. I do have a question tho, the guys like Tim, etc etc who don't mind breaking Federal Law, but they get so upset about a few NG rules that they break as well any idea why?
Thanks for your Time.

He knows Doc. Follow me as I show the group
something here:

If you look at the header you will see that
it came from @ home:

1 Received: from vmb-ext.prodigy.net ([127.0.0.1]) by vmb-wfldad with ESMTP;

2 Sun, 6 Jan 2002 11:21:10 -0500

3 Received: from femail30.sdc1.sfba.home.com

4 (femail30.sdc1.sfba.home.com [24.254.60.20])

5 by vmb-ext.prodigy.net (8.11.0/8.11.0) with ESMTP id g06GImd514594

6 for <S3Buell@SBCGlobal.Net>; Sun, 6 Jan 2002 11:18:48 -0500

7 Received: from hotmail.com ([24.9.144.161]) by femail30.sdc1.sfba.home.com
(InterMail vM.4.01.03.20 201-229-121-120-20010223) with ESMTP
id
<20020106161848.LFWW20127.femail30.sdc1.sfba.home.com@hotmail.com>;
Sun, 6 Jan 2002 08:18:48 -0800

#1 the header shows that I received it from SBC/Prodigy
#2 line shows the time it was received by my ISP
#3 line shows that SBC received it from SF ba area @Home
#4 line shows that it was the ISP for @Home in the Bay Area
#5 line shows that it was transferred to me.
#6 line shows that I received it from hotmail through @Home.
#7 line shows ISP for @Home Md.

So Keith, George knows damn well who posted
this, he is just talking to himself again. I have included the
complete e mail that I received this morning.

Landshark

Now George you can claim all you wants, but this verifies
you as the person that has been trolling the newsgroup as Scott
unit 69. This also explains why you has been hostile towards almost
everyone, what happen to the Shrimp account? I have
been told you hasn't posted from there in over 3 days now.
Could the constant complaints from people to Hotmail
and Google paid off? Doubtful, your is probably laying low
after a warning.
So post away George, you don't bother me, the best
part is that you are pissing far more people off than I

ever could. You are just pissed because the light has
been shinned into your corner and like a cockroach
you are scurrying to get under the fridge to hide.

Damn if everybody doesn't have an opinion. I checked the prices at Bills2Way and without the shipping, I personally think (given the excellent condition of the radios) they're fair prices. Of course this is the Internet and reminds me a lot of CB itself. What can I say.

>Thanks for your Time.

I honestly do not know the answer to that. illegal is illegal, they seem to want to break one set of rules, so the other set being broken shouldn't bother them either or so it would seem to me.

More like spoiled children who want things there way and whine/scream when they lose. Personally, I feel that both sets of rules should be followed. But nobody likes to hear that. As I said before I do not care what people think of me. I know what my friends think of me, and I am happy with myself, thats all that matters.

Youll have to understand also that I have been gone for several months, I was able to check a few times while in NYC, but most of it is lost, and my server has very poor retention. But it doesn't appear that I missed much heheh.

Yeah tell me about it, I got to drive to Columbus Oh today for the executive board meeting of the Ohio State REACT Council.

20 miles from home I got to radio in a auto accident, some fool from out of state decided to drive too fast for road conditions and ended up going across 2 lanes of traffic and then the median strip.

It is done it will yield 3db of gain max, and a different beamwidth. depends
if you mount them top to top or side to side.

So why did Jesus say to god "why did thou forsaken me" when dieing on the cross?
Was he speaking to himself..... no he was talking to a separate entity.

To quote a phrase from Monty Pythons The Life of Brian, "Your making it up as
you go along". The same goes for the Bible.

Dear Scott,
Dammit I told you to STFU about gay stuff
and about how we run the NG and plan to
make Dick M our gay slave.
If you breathe a friggin word of this
to anyone I'll have your ass on a platter.
They don't call me 'butt-cracker' for nothing.

--

If you look at the header you will see that
it came from prodigy.com:

1 Received: from S3Buell@SBCGlobal.Net ([130.1.17.2]) by vmb-wfldad
with ESMTP;

2 Sat, 5 Jan 2002 06:10:11 -1000

3 Received: from 1i5_7.25365$3K1.2109733074@newssvr14.news.

4 (femail30.sdc1.sfba.home.com [24.234..20.10])

5 by vmb-ext.SBCGlobal.Net (3.2.67.878) with ESMTP id 2109733074

6 for <S3Buell@SBCGlobal.Net>; Sun, 6 Jan 2002 11:18:48 -0500

#1 the header shows that I received it from SBC/Prodigy
#2 line shows the time it was received by my ISP
#3 line shows that SBC received it from SF ba area
#4 line shows that it was the ISP for me in the Bay Area
#5 line shows that it was transferred to me.
#6 line shows that I received it from me

Conclusion, either I sent it to myself or Landshark actually sent it
to me. Which makes sense if you think about it. He is pissed at me
about the gay thing and is trying to make me think George is doing
everything when it's really him all the time. I don't know what to do,
I'm scared. George, can you help?

How come you treat Tim better than you do me? Who stuck up for you all
that time when Leland was after you? Who threatened N8 anonymously
couse you told me to? Who tried to start amp discussions to keep our
illegal hold on the NG? Whose pants did I let you stick your hand down
that night on the Marin seashore?
Hell I didn't even know you were married till I saw your ring on the
night stand.

And now you are treating Tim like your best friend. Sure just toss me
away like a used Kleenex. Not that Tim ever did anything for you that
I wasn't willing to do. All you had to do was ask.

LOL this is the funniest thing I have seen yet to date from this asshole, You post parts of a header where is the whole header for starters. Who sent you the email? This is a bogus header, your times don't match look at line 2 and line #7 you stupid ass you had better do better than that, I really like #6 Where does it say you got it from hotmail and @home?? and #7 I find the most intriguing, you say it says @home MD, which is @home in maryland which is Scotts ISP very interesting. If it was from me as you say LOL It would say from PA right, You did say i was in PA. But there is nothing that says I am doing any of this, you post pieces of header info from what from Where are the Ip addresses Landshark surely you know they would show up in there ... Nice try Mark Beck keep grasping for something...
Is that what brought this on Mark? Right my little buddie from Freemonte?

If anyone thinks am posting as Scott-69 or Mopar or even the lowly Landshark Please send those headers and all info to @home let them trace the posts back to me. What a joke, and put me out of business does anyone need help I have there phone number. I want to prove once and for all mark beck aka landshark for the hypocrite that he is. In fact I will help in the gathering of the posts if asked. What have you got to lose it is a win-win situation because if you are correct the NG will be rid of me the sole troublemaker right? my name is george isnt it thats what you guys call me. Step on up don't be shy its time to be about it not talk about it......

Now that you have cozied up to your new best friend, Tim Nebo, I thought I'd take this opportunity to get a few things off my chest, Landshark.

You told me that I was your best buddy (you called me your "butt buddy") and no one would ever be as close. We shared amp schematics and freeband mods. I even came to Marin County that time and stayed over with you, not even realizing you were married at the time but suspecting (but I went anyway). Then lately I stopped hearing from you. Now I see all these posts addressed to Tim in the NG. Tim this, Tim that. It makes me sick. What do you take me for, a fool?

I'll expose you for what you are Landshark, a two-faced hypocrite who sleeps around and advertises in TS/TV groups for partners. Illegal Cb is only the tip of the iceberg.

Keith,
Would the arrays work on 11 meters? Sure, why not. Would they be very practical? Not really, but certainly possible! With the vertical arrays, your talking about at least 2 or 3 times a 1/2 wave length in height, so 35 to 60 feet. Not to difficult to do, but still reaching the point where you would wonder if it's worth doing. Probably easier, or simpler, or more convenient to put up a 50 foot tower with an antenna on top.
How much 'gain' could be realized? There again, it just depends on how much effort do you think it would be worth (still not equal to a good sized beam). Or, with horizontal arrays, how much 'room' do you have to 'play' with? I doubt if it would be worthwhile on a city lot, but if you had a few acres to play with, why not?
It all 'boils down' to how big of an antenna can you make room for, and how much trouble do you want to go to...

I have heard that you can put people who have crossed you in concrete shoes. I just wanted you to know that Landshark may have been talking out of school to Prozac who blabbed the Davemade details all over the net and even posted some anti amp shit. Prozac is guilty yes but the real bad guy here is Landshark. He is a two face for reasons I don't want to get into. But he is the one you should make sure is shut up I mean you don't want a security leak for Davemade being so close and all. I am a loyal Davemade supporter and believe me that takes some guts here in Noname country so if you can help me out I'd appreciate it.

Not sure. Myself, I use my real name and real (maybe this is stupid)
e-mail. Someone (and I don't have the thread this was pulled from, but I
remember it) had mentioned the call. Someone posted to the effect that the
call sign gave to real information. I simply mentioned that anyone can go
to qrz.com and look up a callsign. Obviously, the qrz records are pulled
from the fcc database. Assuming that one follows the rules and keeps the
fcc informed as to their name and address ... voilla! The point I was
making was that a callsign will reveal the individual. Not the same as
assigned isp numbers which can and do change (although quite limited).

Depending on the type of equipment you have or are willing to get
there are plenty of places to go.

29.7 to 30 mhz is one choice. It's just above the ham band.

The other solution is to go down. The advantage of going down is that
the band tends to be open longer. You may want to look at operating
between 26 and 26.5.

i like it too dave but the problem is that when you use those
electronic circuits in a microphone combined with a pa.....rf gets in
them and shuts them off, and that is a fact....if i could find a
echo/talk back microphone that could handle what i do, then i would
buy it and use it , especially when i hear that la marque goober
smoocher on there asking for a radio check....

After 30+ years of radio repair, it's time to retire.
Ham,CB, and Commercial radio Test gear, parts inventory, stock,
including radios, antennas,mics, too much to list here. We are not
interested in selling individual pieces, we would like to sell it all as
a package. For a complete list of inventory, and price, Email
DGENTRY608@AOL.com.
Thanks,
MrBrew

Actually it may not be all that difficult. Since a lot of these guys go through good bit of effort to mount extra alternators and 12 volt batteries into there vehicles to power the 2sc2879 amps. Why not just mount 48-volt alternators and batteries to power the 50-volt amps. Did a quick search and found a company called electrodyne, www.electrodyne.com/models.html, they manufacture a 48 volt 100 amp alternator. One 100-amp 48-volt power supply would have no problem handling a 1200-watt pep amplifier and it should be able to handle a 2400-watt pep amp.

Yes Tim George AKA phony Scott Unit 69
uppluss@hotmail.com
is right. I did complain to his ISP concerning his constant
changing of screen nics to by pass my newsreader filters.
But in a previous posts where he accused me and others of
complaining about his constant forges to his ISP, well
that was made up by George. I guess I should start
forwarding my e-mails now to ComCast.Com.

Take Care Tim,

Landshark

I was just trying to introduce myself and I see I've offended you.
Truth is you sound so attractive that I am at total loss for words. If
I could speak without tripping over my tongue I would tell you that
the instant I met you online I knew you were special. A woman who is
into CB? I never thought that existed until I ran across you. The
French have a saying (voulez vous coucher acec moi ce soir) that
roughly translates as "that special unique quality you bring which is
like the morning sun" which I feel everytime I see your posts. Believe
me TramGal I will back off if you tell me to, but it'd mean so much to
me if you'd allow me to stay. Dunkin Donuts may not be much but it's
a start.

I listened to you, Dick. About amps, about channels, about running big alternators. You were like a big brother to me. You should've looked out for me a little bit. You should've taken care of me - just a little bit - so I wouldn't have to get involved with Landshark that night in the dark and take it in the short-end. I did it cuz I thought Landshark was a cool guy but as soon as my back is turned he's got a new best friend, Tim Nebo. And he's married, Dick. Married. And then TramGal comes along - maybe the best thing that ever happend to a guy like me - and what can I tell her? That I may have been involved with a bisexual who was running around with shemales? You don't understand! I could've had class. I could've been a keydown contender. I could've been somebody, instead of a bum, which is what I am. Let's face it. It was you, Dick. It was you.

Greetings!

Chrysler Concordes are known to have problematic alternators, if you can swap out the 90 amp for a larger 110-150 amp - that would be the best upgrade you can do for the vehicle. Get at least a 700CCA battery, if you can find one to fit in the battery tray. I know you've got the top-of-the line battery, but is the CCA rating [Cold Cranking Amps] going to hold up? I couldn't tell you unless you've gone to the larger sizes with greater CCA ratings.

As far as antennas? Better make that puppy permanent in mounting. You will have problems trying to get a trunk lid or hood to conduct RF energy. Granted the Wilson is not a bad antenna, but it's base loaded. You'll be putting a lot of effort into the RF power situation, but you may not like the results. Having a rear-window defog/defrost option can make this problem worse in attempts to tune. The wires on the window will affect the loading and you'll have to bypass the electrodes to vehicle ground with a ceramic cap or two to keep RF from wreaking havoc with the dashboard controls. RF likes to leak into things and some parts don't respond well to it.

When you run something like a High-Drive, and put it on a stubby antenna, you're only creating a system that is less than effective in power output. You're really wasting money on the antenna if you run high power. Simply put, longer is better when it comes to antennas and high power. With less loading [coiling], especially near the base of the antenna at the mount, the better signal reports you're going to get.

Although the Wilson you've got is close to 1000W in rating, it means nothing when it comes to making the vehicle work as a mobile antenna for your setup when it's in the wrong location.

If you can hold off on the amp install, install the NorthStar with the Wilson first, and try it out. Swap to a bigger antenna if you wish to try a better receive - and you might want to reconsider the antenna mounting and a new location if you get serious. Then shell out the $200+ you need to upgrade the alternator and battery, and install the amp. Thats if you want to. Serious CB'ers aren't shy or afraid to drill holes to make the best of a situation when it comes to antenna needs.

On Sun, 06 Jan 2002 16:40:31 GMT, while the modem was busy tying up IRQ's with the Mouse, "Dredg" <layne@neo.rr.com> dissertated the following:

:+> I need someone's opinion because, I am about ready to make a purchase and I
:+> want to make sure I am making a good decision. I have a Northstar 9000 radio
:+> which has all the extra channels, the radio has been scoped, etc. I have a
:+> Wilson 1000 trunk lip mount for my antenna that is put on a 1994 Chrysler
:+> Concorde. I was recently considering buying a amp and I was told the Texas
:+> Star 350HDV would be my best choice. Considering, I have a top of the line
:+> battery but only a 90 amp alternator, I am limited on my amp draw. The radio
:+> pulls about 7.5 amps and the Texas Star 350HDV pulls around 30 amps. With
:+> that in mind I need you guys' opinion on how good you think this setup would
:+> be i.e. would it be good for dx'ing?, What do you think my average range
:+> would be outside of cleveland ohio where I live?, Is there anything you'd
:+> recommend changing about my system given that I only have the 90 amp
:+> alternator? Is the Texas Star 350HDV the best amp for my money? And any
:+> other comments you might have about my setup.
:+>
:+> I do use both AM and SSB so I do need an SSB delay in my amp. Thanks in
:+> Advance!
:+>

Now why would you do that in a previous post you said I was with @home hell you even got the email to prove it. LOL Keep trying Mark Beck you don't know which way to turn do you. Complain to whoever makes you feel good. Hopefully they don't laugh at you like @home did. As you see your crying fell on deaf ears, all i need to show them is a few of your posts and viola instant laughter. So which is it Mark you cant have it both ways either I am @home or comcast? Either answer you give will prove you wrong Again. Since You got this secret email how could you get it be from me remembe I use comcast. Right Mark

Not really with some qualifications, such as the amp never had the 10m and 12m band included. Thus modifying the amp to add 11m can do what he says IF the person doing the mod doesn't known what they are doing, and the issues involved.

It's easy to blow the output matching circuit Q for a tube amp, i.e. it's too low, then you get a dirty amp even if it does load up just fine. The solid state amps are the worst because many, if not all, are wide band designs using what is called "conventional" transformers in the output. The only "filter" in the system ends up being the antenna, which is not much of a filter either. If you're lucky those amps use matched power devices so the even order harmonics should be greatly suppressed, but may still exceed FCC spec's if used on the Ham bands for example, but the odd order harmonics are not.

Is the Maycom AH27 the same as the Tandy/Radioshack set that looks the same but is UK channels only?
I have the Tandy set and want to know if there is a simple mod to give it CEPT frequencies as well. I also would like to know if there is a car kit that fits the Tandy, or at can you at least get battery boxes so I can make a car adapter and get it onto 12 volts (and presumably then, 4 watts)
Thanks,
Gordon

Kind of a minor point but potentially a real one. When you are designing a Tube linear you will find that things like rf chokes are self-resonant at some point. It is a good idea to make this self resonance somewhere outside of where you intend to operate, it is after all a choke not a series- resonant circuit you have in mind. A lot of the amps pre-WARC were designed for the self-resonances to be at about 25 MHz so one takes a

bit of a risk of incineration among other things as you approach the magic dumping ground.

While the excursion from the 28.6 or so design-center of the ten-meter switch position is not all that great it is on the order of 5% or more which is a whole lot more of one that it is called upon to do in any other switch position. Pi-sections are kind of combination lo-pass filters and impedence-matching devices beloved of the amateur community since I got into this nearly 50 years ago. They are renowned for their ability to 'match anything' which is largely condensed kraut.

While a pi-section may indeed tune and may indeed 'match' far from its design-center frequency the quality of the match leaves everything to be desired from the viewpoint of the tube. And as circuit Q goes to hell, whatever harmonic supression offered by the pi-section tends to go out the door with it. Little tough on tubes as well when the matched impedence is about half of the real plate impedence.

And the reality is that these amps were designed from fairly stock circuitry, one sees a lot of the quad 811/572B designs as well as the classic pair of 3-500s and so on. And they are manufactured to a price point. While not exactly schlock it is wise to remember that such things as tube sockets are not generally of commercial quality and some design shortcuts were employed. The calculated pi-section coils really should have been copper tubing for the currents involved but rarely were. Most of these amps were pretty marginal on 10 meters to begin with and do not improve being yanked out of range. To some extent the manufacturers were banking on the idea that heat on 10 meters is generally not required or used - in Amateur practice not a bad bet.

As far as Ancient Modulation, forget about it. These were designed for the SSB rigs of the day with a fairly trivial duty cycle, not even audio compression.

I would strongly recommend Chapter 13 of the Radio Amateur's Handbook on power amps to anyone before charging into the wilderness.

Ear schmear; it's called harmonics. Splatter is going to be heard all
over the place. And you are going to get it unless your amp is linear.
And your amp ain't linear if it doesn't complete a full 180 degrees --
which your's doesn't even come close to doing. An LP filter might cut
most of the RF harmonics, but the splatter is going to be horrendous,
especially when you are chopping 20% of your signal.

Yes, that makes a lot of good sense, and that's what I have been
trying to point out to these numbskulls for over a year. Higher
operating voltage = greater efficiency = simplified contruction (are
you listening, Prof?). But they would rather do things the hard way.

The limit imposed by the radio spectrum. The bandwidth of each channel
on your radio is based on 3kHz maximum audio modulation. Higher audio
frequencies will intrude on adjacent channels, so the radios have a
3kHz limiter (or filter) to prevent this from happening. Even if you
disable this limiter, the radio's audio circuits are usually not
designed for hi-fidelity and may even sound worse.

Your best bet is to listen for the best sounding signal in your area
(that isn't splattering into other channels) and find out what radio
and mic is being used. You might also try using a good audio processor
(equalizer, compressor).

Those are all valid points Richard. You should point out that many Hams rarely use more than 100 watts. If the band is not "open" all the power in the world will not help so that's why a smart Ham will just switch to another band for DX work. CBers on the other hand just don't know when to quit the power game when the band is dead.

> That would be a 12AU7...

Sparky,

I thought this thread was about a Johnson Messenger 223, not a Whiteface, (Messenger I)!

The Whiteface, (Messenger I), used a 12AU7, but the Messenger 223 came stock with a 12AT7, and most folks substituted a 12AX7 for that increase in MU (triode gain) from 60 to 100.

I originally felt the same way as you did about the grid leak, and made the same arguments, but actual tests proved me wrong and I learned from that.

I won't argue theory with you because in theory you are correct, but the actual bench test results were different.

I attributed it to the combination of the low output impedance of the amplified mike and the longer RC time constant due to that 4.7UFD coupling cap in the mike amp..

Maybe I should have spent a longer time analyzing exactly what was really going on, but I didn't; and now I'm sorry that I didn't.

But that 12-series tube number is a very simple thing for anyone to look up and check to verify my accuracy (or inaccuracy).

In any case I don't have time to argue about this as I am late for an early 'combined lunch & business meeting', so I hope we can just agree to disagree on the bias issue.

Regards,

Dennis O.

You raise a whole new issue, propagation. When a lot of people whose only experience is on the lo-VHF range get onto other freqs the level of amazement rises. One of the oddball aspects of life in the 25-30 MHz range is that almost everything works and nothing works really well. Ideas that make sense at other freqs are grafted on and almost work. Couple this with the tendency to believe mythology and you are suddenly on the Magical Mystery Tour.

A sample piece of mythology is 'horizontal dipoles have a 73 ohm input impedence'. In fact they vary from 45-100 over most grounds and never come close to stability until one-wavelength of altitude. At 50 MHz where lambda is about 20 feet, no one needs to worry, at 7 MHz where a wavelength is about 130 feet and the odds of actually putting it in 'free space' is about zip you worry a lot; where it is about 37 feet the situation is just wierd.

The Class C solid-state amp dates from Motorola Micors to my knowlege and probably before that. They were a pain then but were made to work with enough customer money. When they get to 16, 32, 64 transistor designs, they are simply grotesque. As Dr. Johnson once said of women preaching, it is not that it is not done well but that it is done at all.

Looking for a channel selector knob for a HyGain
model I, II, or III mobile CB radio. All I need
is the silver-painted plastic knob, but if you
have one with the channel skirt numbered 1 - 40,
I'll take the skirt also. I need the knob for a
HyGain I that I have converted to 10m a.m.

Please don't categorize CBers as amp junkies. The freeloaders and
powerpigs bear a closer resemblance to hams than CBers. If you want to
lump them into one of the two groups, pick the other one.

A popular practice, although not always the best idea.

The problem with contact-potential bias is that it requires the rest
of the tube be shielded and well grounded. On the II, the cathode is
not bypassed and is connected to the mic line. The result of all that
capacitive coupling in such a high-impedance circuit is non-linear
feedback, but the effect is small. If you got compression greater than
that, it was probably the impedance mismatch, as you said before.
Since the input was intended for a high-impedance crystal mic, if a
power mic is to be used there must be a load resistor either in the
mic or in the radio.

>Dennis O.

Always watch the grid resistors: the 12AU7 on the II uses a 4.7Meg. That's 10 times too high for grid-leak bias. The advantage of contact-potential bias is very high input impedance and high linearity, and with very low signal levels. The grid potential will never reach cutoff, and actually 'swings' with the cathode current. You will find the method used in many of the better audio preamps and phono pickup circuits. I don't think it was the best choice for a CB radio.

Trying to get a neat solution to handling the high DC currents involved is
not easy, particularly when you can't afford much in the way of a voltage
drop when you only have 13.8 VDC to start. The move to higher voltages
should make that easier. A 36/48 VDC bus in your car would make a full legal
limit amplifier easy to install. At 1500 watts, 60 percent efficiency that
works out to 2500 watts input, and at 48 VDC the current draw would only be
52 amps.

> As Dr. Johnson once said of women preaching,
> it is not that it is not done well but that it is done at all.

Yeah like some of the nut case CBers who pull a trailer behind their truck,
filled with batteries, just to power their 11m amplifier.

It is true but a bit deceptive. You get a narrow primary lobe
perpendicular, plus a lot of narrow secondary lobes as the system
approaches being omnidirectional. At 0 degrees it is gangbusterly, at 15
degrees it is deader than Mrs. O'Leary's cow.

Kind of like some antennas with remarkable F/B at 180 but barn doors at
160 and 200.

Phil, I didn't say it was impossible nor did I say they don't make alternators that put out 48v, but you need to think about what you are asking
now you need either a 48 volt battery or you now need to series 4-12 volt batteries, what about for the guy who runs 1 big alternator? Does he need to convert his mobile over to run 48 volt starters etc. No one said it can't be done it just isn't as manageable as you say for the average person. As far as these keydowns read big radios .com they say no 50 volt devices. So in the end what will be the cost of building a 50 volt fet amp and associated parts compared to the old stand by bi polar 2879 for the same watts.

A. 50 volt devices have been used (House of Pain, Hot Springs Ak)
B. They did win some classes
C. They lost some classes.

They cheated, using 50 volt devices in a 12 volts keydown. However, since nobody had EXPLICITLY
said they couldn't run 50 volt devices, they kept the trophies they got, if I remember correctly.

50 volt devices aren't as tolerant as the 2879 to overvoltage and overdrive. And a properly overvolted
12 volt transistor can do a HELL of a lot more than the limited overvolted 50 volt device.

Ask peekabo about the 2 transistor 2879 amp that does 750 watts. Bird watts.

With the spec-an to prove it
and the PEP values to prove it
And the keydown on the line time to prove it.

Thats a little more than anyone else gets, and its a hot box, but we do get 500 watts + out of 2 transistor 2879 amps. To get that out of a 50 volt device, you are almost driven to the FETs. And as someone else pointed out, the cost becomes a factor at that point.

Not to mention, half the cb hacks building amps now can't deviate from the design they are copying.

Monty Python IS an Anti-Christ. The Bible is not made up "as you go along." God (The Father who he was saying that to) took his eyes off Jesus his son when he had all the sins of the world on him (includoing yours), and a Holy sinless God cannot be in the prescence of sin. Jesus had voluntarily took the sin on him so that WE could live and not have to have the sin on us when we die, so we won't have to go to the Lake of Fire, which was made for the Devil and his angels. So if you are SORRY for your sins, repent (turn) from them, and believe the GOOD NEWS of what Jesus DID, then you can be SAVED. He said that you MUST BE "Born Again." Jesus was God in the FLESH, The Father is in heaven, and he sends his Holy Spirit NOW that convicts of sin.
I meant Matthew, not Matther.

Source record: 111367

Go to http://www.xmission.com/~lkilgore/pages/antennas.html and get
the free program. To execute it after unzippint it, type "antennas"
at the dos prompt. Choose selection "1" for the two phased verticals.
For the antenna spacing, choose 1,8. For the delay line, choose 1,1.
For the degrees, choose 1. When you see the radiation pattern, you
might be surprised.

This will plot the radiation pattern for two phased vertical antennas
spaced 1/8 wavelength apart, and in phase. As can be seen, there is
almost no difference between this configuration and one using just a
single antenna. -Frank N7FP

Source record: 111369

Using the program Anpat8ae.zip, it can be seen that the radiation pattern of two antennas spaced 1/4 wavelength apart and in phase is about 3 db increased forward and backward, and no gain or loss to the sides. Since an "S" meter usually indicates 6db per S-unit, it appears that a 3db gain will hardly move a remote receivers meter. It doesn't appear to be much use to use co-phased antennas. -Frank

>That IS FUNNY Phil, and since it is The State's electronics store, they
>probably won't go out of business. Just think of the GREAT places it
>(supposedly) put out of biz: Allied, Lafayette, Olsen, and whoever else.

Olsen was a junk store. Lafayette put themselves out of business
by focusing on CBs, bad locations, and expansion too late in the game.

Allied is still in business, but mail order only. AND owned by RS.

There are PLENTY of other electronics stores, at least in most places.

To reply by email, remove the XYZ.

Why don't you start a trend at these keydowns to make audio quality
and spectral purity a requirement. That's what radio is about, not
about RF tractor pulls.

>Ask peekabo about the 2 transistor 2879 amp that does 750 watts. Bird
>watts.

Now what the hell is a bird watt? Is that how many birds that will
drop dead off the antenna when the radio is keyed? I have a Bird
wattmeter and it reads just the same as any other wattmeter, it's just
more versatile.

>With the spec-an to prove it

You, like so many others, are still missing the point: Nobody is saying that these things aren't possible, or that they don't exist. In fact I have seen some pretty wild setups, too. What I am saying is that it's absolutely ridiculous! It doesn't make any sense to go through all the trouble and expense when there are simpler, more efficient and more reliable solutions.

Not only that, you are perverting the underlying concept of radio communication, and that is "communication"! If you can't communicate with normal people on their level, get yourself a speech therapist, or seek help from a shrink to get you over your fears. Those are legal and practical solutions to your problem, and they don't fuck it up for everyone else, either.

1135. range of `illegal' cb frequences?

Newsgroup: rec.radio.cb
Date: 2002-01-08 02:29:46 UTC
From: "Wm. Bernhard" <anon779f@nyx.net>

Folks,

Tuning around the 11-meter band I noticed what appeared to be cb contacts in the area of 27.400 mhz. I know that one can get `extra' channels up and down from the standard 26.965-27.405 mhz allocations, but exactly how far down have people pushed the proverbial envelope?

I understand there are some reserved military frequencies in the 27 mhz band (six I saw on one post) if so where are these?

If anyone can say what the frequency range up and down for cb modifications are, I and probably others on this group, would appreciate knowing them.

Thanks,
Bernhard

The ENTIRE CB band goes to Channel 99 (27.995) 35 - 99 is mainly for SSB and
below channel 1 usually just about 20 channels or so, or maybe another 40;
are on AM for the most part. However, some go way down to 26.0 or even
lower; but not many (I don't usually ever go down there so I don't know who
talks there). I have been telling people for years that there are only
about 120 or 140 "usable" CB channels. Some would say that you can add a
lot more on the LOW end, to go to the 26 mhz SW radio band!
Dave

The entire spectrum above 9kHz is allocated. The freqs above and below
the legal 40 are designated for both military and commercial use. Even
though some freqs may seem like they are not used or even abandoned,
remember that someone else has the legal right to use that frequency
at their convenience, not yours.

OMG, A real honest-to-god technical question! :)

well, lets see, standard is roughly 16 or 14 ga. wire. Hpwever, if you
don't want to worry too much about current losses, use 10 Ga. and a nice
fuse holder inline to your supply.

Also, make sure to ground the system properly. amkes things nicer not to
have all that RF running around the shack.

Technomage

Red = positive

Black = negative

White = Is probably a lead to sustain the memory of the
radio when the car is turned off. If so it must be hooked to
a full time positive terminal rather than an ignition only
positive.

Gauge = Anything from14 gauge or larger.If you use 14
then keep the run short.

The problem with "behind the lines" E-mail, is that it defeats the purpose of an open forum, such as what this newsgroup is supposed to provide. It's a shame that a relatively vocal minority managed to wreak the newsgroup for the rest of us. I suspect that there are quite a few people that have been driven into just "lurking", due to the abrasive atmosphere that has been prevalent in this newsgroup. Many of these people would be great contributors of knowledge, if they didn't have to fight through the "noise level" of the trolls etc.

> Point is, that any ng is like panning for gold, ya have to throw what
> you don't want. I think Doc said that, great analogy.

Yes it is. But when the throwaways exceed the gold, you soon get tired of panning.

>
> In CB and Ham radio you will always have the smoke and mirrors stuff.

True, but it seems more prevalent here, as there are a number of people that don't know all that much, and unfortunately, there are also way too many people willing to take advantage of these naive people, who don't know any better.

> Load down the rotor, or ......?!?!?!?!?!

It's a funny thing with antennas. Cbers have always looked to get the best efficiency that they can out of their antenna, as they are usually stuck with pitiful power output, and look to the antenna to make up the difference. Hams, on the other hand, are not as concerned with gain, as they are with bandwidth, SWR, and noise performance.
It's not much use to a ham to have a vertical antenna that has 6db gain, with a 2:1 bandwidth of 50 Khz on one band, and loads up (with the tuner) like a set of bedsprings on the other bands. On the other hand, Cbers do not have a need for an antenna that covers 10 thru 80 meters with a gain of 1.

Hello Sparky: I would think with all that high powered education that you could do the math and get the answer. And would know the difference between "marketing secrets" and how phased arrays work, maybe not.

Look at the ARRL Antenna Hand Book, Chapter 8, see all the antenna patterns.

There are three basic things you can do:

1. Antenna: Get a 102" whip, or move your antenna to the top of the vehicle. Make sure the threads are waterproofed with an o-ring or some other type of seal. SWR is fine if it is less than 2.0, or 2:1.

2. Coax: If it's old or if it's a foam-type coax, replace it with some good stuff and use good quality connectors (not crimp-ons or twist-ons). Keep it short, avoid sharp bends, and coil any excess into a figure 8, -not- a loop.

3. Radio: Since it is 12 years old, take it to the shop and get it tuned up. This will improve both your receive and transmit range. Make sure the radio is mounted to some metal, or run a thick wire from the radio chassis to the closest point on the firewall.

Do those things and you won't need to mod your radio. Also, there are many factors beyond your vehicle that can limit your range, like tall buildings, hills, etc. If you live in an area where those things are common, there is not much you can do to improve it, and even a power amp won't help.

Judas Iscariot Holy Roller Priest!

Tell that to KFAB a local 50kw boomer on 1110 who now and again manage to wipe out CHU the Canadian time station on 3330. The second harmonic of CB takes out TV Channel 2, the third takes out Channel 5, the fourth gets the FAA on your case. Bands are set up for a reason, Brian.

OK, you're a klotz. But you should still care about them. Even with a well-matched antenna system at 27 MHz, second harmonic energy is going to hit the antenna and get sent right back to your finals there to blow them up. A 1:1 at 27 MHZ is not 1:1 at 55 MHz believe me. A nine-foot whip will handle and radiate the third harmonic but a loaded antenna will barf and ship it back as well.

Ever wonder why groupies notice that their SWR goes up with their amps? You just found out why. Wonder why munis are passing laws to harrass the living shit out of amp owners? You just found out why.

Back to the books, Prof. It is increasingly apparent you know just about enough to be really dangerous.

Ok I have 2 Hygain mobile radios
one is a Hygain II other is a Hygain Hyrange II, the first has a knob that isn't worth trying to salvage, someone drilled a hole through it and secured it to the radio with a long bolt, the second is in good shape.

Let me know if this is what you want.

I also have a bunch of other older radios in working order, as well as some that would be good for parts, I will compile a list.

First you want to have the radio checked
that it is working perfect. Second, while a
Wilson 1000 is a good antenna, you may
want to consider a different antenna. A
102" whip or a loaded antenna like quad
wound or shipshooter or firestick for example.
You match is good, though I would change
the coax if it is more than 3 years old.
Last would be an amp, but understand
it is illegal and can get you in trouble if caught.
You also have to know what type of alternator
and battery set up you have in the car to be
able to pick the proper size amp.

Good response Dave.
The antenna on a cb is probably the
most important part. If you run legal
or illegal you have to have the most efficient
through put to get your signal out. Think of it
this way, a funny car motor slapped into a
Ford Focus without any modifications. You
would have one hell of a powerful motor
with no way to get the power to the wheels.
Yes while the hams are more concerned
with broadband, cb'ers should be more concerned
with getting their signal out the best way it can.

and what frequency chart are you referring to???

Class D service (as defined by part 95) exists in a narrow band from
26.965 to 27.405 in 40 allocated channels, period. anything outside of
that is not licensed for the class D service 9and your use as such, is
unauthorized).

so, if you don't wanna tangle with the government, keep off the "free
band" frequencies.

Cross-posted to: rec.radio.cb,rec.radio.swap,rec.radio.amateur.swap

Once again,

A shameless plug for the Siltronix & Swan 1011 web page at:

http://sonic.ucdavis.edu/siltronix

Lots of history, some great pictures and a few manual down load. There are some pictures of the various Swan & Siltronix options.

Life is short
Eat Desert First...

cheers
skipp@pilotNOSPAMPLEASE.ucdavis.edu

I think there is talk on expanding the 11 Meter Hobby band down to 25
Mhz range for RTTY and low power SSB contacts and some Amplitude
compandored sideband tests also.

Hooray for you. Maybe the guy doesn't want to chance a $17,000 fine
from the FCC for playing with what amounts to a toy. You must enjoy
trying to persuade people to take such risks with their legal and
financial future.

Yes, you could get an amp. That would allow you to get above the
signals of everyone else using an amp. But then they will want to get
above your signal and get a bigger amp. So you then get a bigger
amp...

Or you could just change the channel.

Given the current state of affairs in Manhattan with the clean up effort,
and huge communication activity that goes with it, who in their right mind
would take such a stupid chance running illegal power like that.

I hate to say it, but it would probably be similar to 75 meters at night. Geeze, gang - could we all lighten up? Some folk abide by the rules, others don't. This applies to CB, amateur, and investment bankers. There are good police officers and bad. I'd love to see all the flames die down. It's getting so that some of the hams are forging posts of their 'enemy' CBers just to get more hams' panties in a knot (yeah, I fell for one of them). Once in a while, I'd love to see some honest questions and answers (and there was ONE recently). Go ahead and flame away, I've got my asbestos long johns on.

73 from Rochester, NY
Jim

ps - Mopar, this is NOT directed at you - hopefully, a few folk will understand that none of us are getting anywhere causing trouble - especially some of this sexual innuendo and outright porn that has no place in the newsgroup! Just my 2% of a buck's worth.

any one out there using the turner
expander 500 mic ?

what i need is this ; on the component
side of the pc board, upper right, there
are six pins. i need the pin outs for
these pins.

tnx in advance.

oh good grief leland.....lighten up......tell me.....you don' think
that there are folks using linears in new york...get a grip...what
about the taxi drivers.....????? and the truck drivers???? and the
cb nutts ????? there are, after all , for your info, 5 boroughs that
compromise new york.....so manhattan is a mess right now. blame that
on the former president, and leave the cber's alone while they have
fun.......no doubt about it......

Well, Let's get right to it....you guys in Texas had it going on over the holidays..from the Peach to the hills of Appalachia to the Keystone to the Big Apple it was all 'horn..y'all know who you are. Out of everyone I tagged, you Texas radios with the big beat were in my receive daily (next to the 'pile of course <g>), Ok, ok, Texas, you were louder than the 'pile stations that I heard this ONE time, BUT.. now that I'm home <g>....
-
Sounded like a holiday party, never had such a good time...open line daily, direct dial..heheheh..who needs a cell? That freeband freq. is like a fine wine, it get's better with age. Hell, it feels like family now, each time someone keys up it's a familiar voice, but man, is that family expanding...seems like lotsa new folks coming around these days. The more the merrier. Plenty of good radio folk making their presence known 'round the dial....don't ya' just gotta love it!
-
Got to talk to a few familiars from DX land in their own territory and was welcomed like an old friend. Preacher man (WV) , thanks for the hospitality, y'all come on down to the swamps some time and y'all will find ya' fit right in with these good 'ol boys.
Big apple trees on Christmas Eve to my pickup from West-by-God, dude, you had it going on 'fer sure!

Showtime you had my attention across the Carolinas (again). The tiny NEW Biff's burger joint in Rock Hill needs a better frequency for their drive-thru..they're in the dark ages and if you ever are in the area, stop in there and introduce yourself...they heard your name..several times.
Prospector, Renegade and John Doe (wheatfields) I managed to tag almost daily right up to Christmas day.

Speaking of Rock Hill, the man himself is supposed to live there. I had my scanner with me and was actively listening for his call, but no such luck. I then popped open a phone book and checked out all the Hollingsworth's there, and there are quite a few, but no Riley. There was an "S", but it was not correct. Funny though, the party at that end said "say WHAT?" when they asked who I was and I replied with "twisteded." Hell, I thought if it was his number, he'd know right away who it was, unless of course, I was lied to by one of my pack hounds, which would be absolutely unheard of and the closest thing to an atrocity being committed in rec.radio.cb that one may encounter. Perish the thought.

I was hoping to buy the man a cup of java, maybe even speak with him concerning the ever escalating problematic operators within the amateur

radio service and what he plans to do about it, if anything, now that another budget cut took even more funds away from the enforcement divisions planned staff additions, equipment upgrades, etc. My prediction..watch for the smaller offices to be downsized to the staff of a skeleton crew or be closed altogether by the end of the Bush/Busch run.
I did speak with Riley soon after his appointment but it was more about whether he held political aspirations for the future.
-
I also was going to call QRM's realty office while I was in the area and maybe look at a few acres in the sticks on the border of NC and SC for recreation (plus a tax deduction), but I heard he has somewhat of a bum ticker and I didn't want him dropping dead on me after introducing myself. Dealing with the coroner's inquest and explaining his self constructed house of cards was not my idea of the way to spend the holiday. Plus, his ex would lose the alimony and she never did anyone any wrong.
If anyone knows (personally) a good realtor around the SC/NC borders or southern or western NC dealing with raw land (not lots, parcels, or soon to be developed land), send me their name, number, web site, whatever.
-
For those of you whose numbers I had, all good intentions were planned until the yankee germ crossed with the southern germ and all hell broke loose.
Got good and cold in the northeast and even managed to whack a yankee deer (just walked right up to me and looked at me with big brown eyes like I was gonna hand him a sugar cube or something). Beef Jerky and plenty of dog food (212 pounds). Next morning, the yankee germs finally got the better of me...caught me and did a job on me which turned out to be what I thought was one bitch of a flu......pneumonia.

A premature but well needed retreat back to Dixie (and the sun, AND saner temperatures) and them yankee germs died off with the aid of a few antibiotics from the union doc and some strange stuff the deadhead chick that moved into the widow's place has me breathing..smells like fennel broth and looks like seaweed but it seems to work.
Feeling better and ready to send some yankees home with pics and tales of great fishing aboard the new skiff. The Antron is mounted on the bridge and folds down (on a rotatable swivel and lock) when not in use.
Going out this Friday, Saturday and Sunday to the Bottoms, usual freqs.
Aahh, it's great to be home. Think I'll watch the weather channel all night long.

Breakin' the law around Tampa Bay

> Now what the hell is a bird watt?

Wattage, as measured on the de facto standard, the Bird Wattmeter.

Is that how many birds that will
> drop dead off the antenna when the radio is keyed? I have a Bird
> wattmeter and it reads just the same as any other wattmeter, it's just
> more versatile.

If that is what your seeing, your either buying high dollar wattmeters,
or you have a Bird that is way out of alignment (the Slugs).

Usually a wattmeter will follow close, but not exactly on a Bird.

However, again, your nitpicking.

>

With the people who have experimented with high power RF, I doubt it.

After all, 750 watts is 3Db down from what legal limit is.

>

> efficient and more reliable solutions.

Except we enjoy what we are doing, pushing the devices to the limit is
part of the thrill. Being able to say that you have the rest of the system
dialed in,
and WORKING at 23 or so volts is a feat in, and of itself.

Of course, some people choose to do the exact opposite. We don't ridicule them for it,
though.

>
> Not only that, you are perverting the underlying concept of radio
> communication, and that is "communication"!

So does amateur contesting, but we have been through that already.

If you can't communicate
> with normal people on their level, get yourself a speech therapist, or
> seek help from a shrink to get you over your fears. Those are legal
> and practical solutions to your problem, and they don't fuck it up for
> everyone else, either.

Neither do the keydowns. They are held in usually isolated areas, with people that enjoy it.

We don't trounce on you, I suggest you stop attempting to tell us we are wrong, and you find something else to occupy your time rather than arguing the
finer points of RF design with people who "really don't care what the textbooks say,
we are going to try it anyway".

After all, if we all listened to the forefathers, Europe would be a CROWDED place!

Toll_Free

(And yes, most of my equip is biased, mod limiters intact. I just happen to see
that their ARE people who can enjoy something I don't anymore. And I don't have
to down them for it, either).

Are you claiming that you can't get half voltage at twice the output
amperage?

You aren't going to get nearly that much out of one at "operating
temperature", either. They have to be cold case.

I have a Leece Neville 165 amp alternator, brand new (sans test time) that
blew the motor in the test jig at my old alternator place. It was showing
18 vdc output at close to 225 amps.

Thats impossible, huh?

Alternator ratings are at operating temperature, at a given RPM. Given the
12 and 13 inch diameter pullies that some of these guys are running (I think
some of the bigger AC 1 alternator guys are even bigger than that on the
crankshaft), and the miniscule pullies used on the alternator, you can get
quite a bit more out of them.

Think 600 amps is off? Ask Bluegill. Thats what he spec'ed them at. In
his mobile.

I have seen the amp that Phil talks of. And its a monster :)

Toll_Free

Re: While pondering the whole radio hobby I had a thought......
no-spam@junk-mail.net (Leland C. Scott)
"Tim" <timnebo@aol.comLOL> wrote in message
news:20020104100919.16462.00001741@mb-fq.aol.com... if everybody in the
world was only running 4 watts AM channel 19 would still be full blast
with noise everyday and all 40 channels would still be full. thats
mother nature doing it not the amps.

-Not true Tim, and you should know better too. What do you think it
would be like if a group 30 miles across town used only 4 watts while
keying over each other compared to running 250 to 300 watts doing the
same thing? You would really have some dumb CBer on this news group
believe they wouldn't notice the difference, get real. If amps didn't
made a difference then why do you find it so necessary to run one
illegally?
--
Leland C. Scott
KC8LDO

"Of all the DX and countries I have ever heard, I find myself
embarrassed
for our own operators here in the
states. The high profile spectrum
splatters usually get their due,
one way or another. Unfortunately, for
many fine operators and listeners it
doesn't come soon enough."
Quoted from Twistedhed's essay at:
http://sporadicwaves.tripod.com/page8.html
--
  Hello "Nad. Glad to see you still championing the article. It is
definitely a true thing that the high profile spectrum splatterers get
there due, whuch is why there are so few of them and why the problem is
almost nonexistent.
Quoting select lines and isolating them from the context in which they
were written conveys to the masses the level of comprehension at which
you are comfortable.
  Given the extreme and long lasting emotive reactions my words can
provoke from you without even breaking a sweat, one must logically
conclude that either the piece is brilliant and you still haven't
stopped wetting yourself over it years later, or B) you have a mild to
moderate psychological disorder.
  Your problem has always been an over concern for other's
business. Simply because I choose to take great pleasure in pricking
overblown egos such as yours and graciously make your bullshit lies and

forges amusement folly for myself and others is no reason for you to act the way you do. Really. It merely is light entertainment that ranks marginally ahead of watching old fishing rerun shows with good 'ol Orlando Wilson on the scale of interesting and fun things to do.
-
I have learned that there are several aggrieved nocodes hanging here who are not appreciative of their own hobby, how could you (they) appreciate anothers?
Catching up on the posts has proved a daunting task indeed, but one thing has remained constant, the behavior exhibited by yourself and the other discontented few remains the same, so no sense in asking if you had a good Christmas.
I need to ask the group a question though..since Lelnad was here a bit before my arrival, has anyone else ever had this effect on him before, or am I the sole lucky bastard recipient of his unconditional love? Did he ever refer to others as often as he did me during absences or am I the lone object of his affections?

When one really thinks about it, it becomes apparent that repeated personal attacks and acts directed toward someone by another with no other reason than to malign or harass, or to make another feel bad or to embarrass them, is one of the highest compliments one can pay another..... By acting in this manner you are admitting that the individual you are repeatedly lashing out at and attacking has caused you great anguish or grief, so great in fact, you are admitting that you have failed to be in control of your own self, you have allowed that individual to come into your life and affect it in such a profound manner that you must somehow react. Your emotions are getting the better of
you and you have lost control long ago.

I consider it of the highest honor to be disliked, misquoted, forged and constantly referred to by swine such as yourself. Thank you.

T, the amp is not good for 11 meter use in the USA according to our FCC
Commission being from Canada I am not sure If you knew this so please do
not try and sell this to anyone in the USA. There are strict federal
laws re: Importing Illegal Items into the USA, as well . If you get
caught that is.
--
Still babbling incoherently and attempting to spread false information.
Better brush up on your knowledge concerning trade laws...just like
foreign pharmacies (among a host of other examples), you can order from
them but the penalties apply to you not the sender, who in this case
happens to be in Canada.

perhaps you need a new radio doc. nobody locally or dx splashes all 40
of my channels. sounds like you have no rejection. you have to spend
money on qaulity equipment if you expect quality communications. the ham
bands and the cb band have never and will never be alike. perhaps you
should get your ticket an abandon 11 meters because it doesnt seem like
your happy there. if
everybody in
the world was only running 4 watts AM channel 19 would still be full
blast with noise everyday and all 40 channels would still be full. thats
mother nature doing it not the amps.
Now explain this to me? Why is it hams can communicate all over the
world
w/o bleding/splashing the bands? And at the same time why is it that
people who run power and poorly modified equipment on 11m and the
"freeband" can't talk w/o splashing all 40 channels, bleading everyone
in town, and making life difficult for those of us who just want to
simply ragchew with our friends?
             73 de Tim
http://www.TimNebo.com

(snipped for brevity)..and I get blead because there are idiots in town
that are running several thousand watts with opened modulation, hence
they do splash all 40, and as I stated in another post, they also wipe
out our emergency communication freq's i.e. napoleon pd, county fire/ems
freq's. So it isn't just my radios being effected.
When these guys interfere with emergency communications lives are at
stake, this is not a laughing matter. And do't start telling me that the
radios we use are poor, or that it is impossible for 27Mz to splash
154Mz because it IS happening.
Keith "WebDoc" Hosman

--
Again I am shocked, absolutely and
pointedly shocked I am, to learn that a topic among us is anything but
irrevocable proof or cut conclusions, maybe opinions from acclaimed
radio or media gods. Severing the public from learning more of these

type happenings are for what reason? You can help spearhead a domino effect against all those rabid cbers with all that interference.
Seriously, can you be a tad more speciic, Keith? Clover or Orion's FD? Annawhan? There are too many to guess. Which EMS? Hooppole? Tampico? Atkinson? Again, too many. Napoleon PD itself? The communications division (one would think) at the Henry County sheriff's department would be aware of such recent interference to it's communications, no matter how trivial, so certainly they would be aware of it on the grand scale you suggest it takes if it were happening to them. Is this happening on a trunked system?
Your local media banks carry nothing concerning current interference problems to EMS communications. That info is culled from, among other sources, the sheriff's records and is updated at least once per shift.
Enlighten me, Keith.

Source record: 111541

And what did Jesus say to those who were trying to trap him in regards to how far one goes
to follow the Lord and what one owes to the government? Do you remember a quote that went, "Render unto Ceasar (government) that which is Ceasar's, and to God that which is
God's". The two concepts are not *necessarily* at odds with each other when it comes to obeying reasonable laws such as those that apply to the use of radio. The radio spectrum
does conceptually belong to the people, although some other governments in the world don't
see it that way. In order to make it possible to maximize the availabilty of said spectrum, gov-
ernments enact laws and enter into treaties with each other in order to share that spectrum.
Without such regulation, the ability to use radio would be severely restricted due to interference,
and there could even be wars fought between countries over such a "minor" thing as inter-
ference. What you advocate while spouting about a form of government that has been discredited is anarchy. You want a hobby band expanded to include everything and every
band in known existence and the heck with necessary and useful communications needs of
others engaged in business, commerce, police, aviation, and even other hobby services that
require *some* demonstration of one's ability to use the spectrum with knowledge and restraint. YOU just cannot seem to stand the fact--and it is a FACT--that CB occupies the
least important rung on the ladder of radio needs, so you hide your own lack of knowledge
behind a facade of anti-communist rants that hide nothing, and, OTH, actually serve to show
how little you know about how the regulation of radio spectrum works. maybe you know how to fix a CB, but you do not know WHY things are as they are. If you are doing that just to
see if you can stir up things, I would say that you are, again, going against your professed
Christian beliefs by provoking people to wrath with this stuff. I cannot understand why you
cannot express yourself in a normal, mature manner without screaming that there is a communist hiding behind every fire hydrant. Your credibility would increase many fold if you would express your feelings without the commie crap!

Oh sorry JR he is not talking about a legal expansion. He is talking
about a mass movement of people to expand the 11 meter "hobby" band
[which includes the freeband up to 29.999] by experimenting at 25 mhz.
If you think about it this is the way we got up above 40 in the first
place and by proving there was a market inspired the manufacturers to
support us with export radios.

I am wondering what exactly does happen if you a caught with an amp. Also saying that big power splatters all 40 and even more all the time is kinda a larger statement don't you think. I know a guy in MS who has 6000 watts behind his seat. I was about 300 yards from him and he wasn't bleading on ANY channel, not even 1 up or down. I personally am afraid to run any power. For some reason the letters FCC just sound mean go ahead say them a couple of times out loud, but I don't think I could hold anything against him for doing it.

Why would you want to use a broadcast microphone on a ham radio rig?

Go see a demonstration by Bob Heil, K9EID, to understand that
question. Then buy a Heil mike.

Showtime,
Try a Heil HC-5. Turn on the compression but run it at
a very low level, (a sharp whistle should only produce one
'dot' on the scale). Mic gain set about 9 o'clock. It doesn't
get any better than that. DON'T use a 'studio' mic. DON'T
use wide (or no) filtering. DON'T believe all the 'bull' about
'broadcast quality'...

Twistedhed you jackass the person recieving it would be the importer, I did not say the sender would suffer Go sniff that jockstrap somemore. your losing it.

Still babbling incoherently and attempting to spread false information. Better brush up on your knowledge concerning trade laws...just like foreign pharmacies (among a host of other examples), you can order from them but the penalties apply to you not the sender, who in this case happens to be in Canada.

My compliments on what has to be one of the more bullet-proof receivers in existence. It would be a major technical achievement to hear anything that close to even a perfectly clean and filtered 6kw. You sure as hell are not going to do it with the usual run of cheesy CB front ends.

You raise several issues that deserve an answer but they all come down to an old brown-shoe Army axiom: Rules were made to be tactfully disregarded -- the key word is tactfully. And you must admit that tact is not a plentiful commodity near 27 MHz.

What would happen if you got caught, and it would take either an accident right up with getting hit with a meteorite or a remarkable ongoing lack of tact to have this happen, is the loss of the amp and an NAL (Notice of Apparent Liability) for about $3,000. As a practical matter, ignore it because your local Federal DA doesn't get interested below $10k and confiscation of your car. There is a risk, of course, the DA may have a rookie in training and use you for a tackling dummy. Your attorney will relieve you of any remaining cash in any case. Your basic hassle.

Can amps be built clean? Yes. Are they? No. If you can buy one that is clean out of someone's garage it is only because he hasn't figured out how to sell them to bozos. What the hell, splatter, harmonics, parasitics, and used kleenex show up on that there Bird meter and the heads go up and down and wallets come out. When the manufacturers are six weeks from 'want fries with that' and the buyers have all the savvy of the average drug addict what in hell do you expect.

Assuming one buys a clean amp after being being struck senseless by the aforesaid meteorite what makes you believe it will be operated within its design limits? Loud man, my amp goes to 11. Goose it one more notch. Make it AM, or Antique Modulation as I prefer, where the limits of tolerance are really close and the penalties for stupidity high and chaos will reign supreme. The penalties will typically be paid by others, at least right up until the smoke comes out of the box, so when one is having a manhood problem the word is 'and the horse they rode in on'.

And then the driver has to be clean. It is a fair bet that the basic transceiver has been subjected to the Golden Screwdriver down at Happy Joe's Truck Stop, Funeral Parlor, and Emporium of CB Delights. This treatment includes disabling the harmonic traps -- remember Birdwatts -- and clipping the modulation limiter because limiters are Un-American. That this actually reduces talk-power is no big deal; sell him an amp.

And we put this on the air in the presence of receivers built in Guandong Province (right up the Pearl River from Hong Kong) built from cheesy designs executed cheesily and sold down at Happy Joe's. Selectivity, what is that?

No, I can't hold a lot against your MS amp owner. He is a participant in a comic opera.

Dick N&#65533;BK

Yes the 165's are no different that the 200's same rotor and stator, 225amp
is a far cry from double the output rating as you suggest.

>
> Thats impossible, huh?

600 amps out of each stator is, getting higher amps than they are rated is
not, never said it was

> Alternator ratings are at operating temperature, at a given RPM.

And they are not endless power supplies either, spin it a 20,000 rpm you
should be able to get 1000 amps if your theory is correct.

Given the
> 12 and 13 inch diameter pullies that some of these guys are running (I

I hate to tell you that the Bird wattmeter is only a "standard" on CB.
We use them at work but they are most inaccurate from my experience.
They claim to be 5% tolerance but in reality... some of the slugs may
be closer to 10%.

I use a real wattmeter, an Agilent E4418B that's about 2% accurate. It
rocks!

The Bird is the most popular in commercial usage because it is rugged enough to drag up the stairs to the penthouse, drop it a few times, and toss it on the truck to rattle around. Because in the vast majority of cases you are only interested in the output being somewhere near nominal accuracy is not a big issue.

Because there are a lot of ways to measure power depending on the problem at hand, some highly inventive meters are used to unload schlock on the rubes. The Birds for the most part do good old water-boiling RMS output and are not subject to a lot of creativity so they have become standard for CBers to avoid the more blatant highway robbery practiced down at Happy Joe's Truck Stop, Funeral Parlor, and Emporium of CB Delights.

Someday, perhaps, the rubes will discover that Birdwatts include splatter, harmonics, parasitics, and a partridge in a pear tree.

If you do a lot of freeway driving with the stereo on, you probably will notice that some of the truckers that run power will blast right on through the FM band (or even CD player!) without even breaking squelch on the CB.

There are several kinds of interference. One is from modulation harmonics, which is called 'splatter'. That distortion stays close to the fundamental frequency, but can extend several hundred kHz up -and-down because they are carried on the sidebands. Another kind of interference is from RF harmonics, which are multiples of the transmitted frequency. These can fall on the TV stations, and freeloader freqs will fall on FM broadcast, TV, VHF and government freqs. The third kind of interference comes from unintentional rectification or induction, and that's when someone can hear your radio through the stereo even when it's turned off. If you drive past a powerful AM broadcast tower, stop and see if there is a chain-link fence nearby -- chances are that you can hear the station by listening to the fence! There are other types, such as when an IF frequency is poorly filtered from the transmitted freq and is amplified -- the result is that any radio with the same IF is going to receive the transmission.

But the most prevalent form of interference is the power itself. A high-power transmitter covers a larger area, an area that could normally be used by many people at the same time. So in a city where thousands of legal operators could talk, the airwaves are clogged by a few powerpigs.

There are some illegal operators that run clean, but generally the IOs do not observe good engineering practices, and most don't care because FCC enforcement is poor. Most also ignore the possibility of damage caused by vigilantes (pissed-off mudducks), and when that happens they don't have much legal recourse.

If you read some of the files on rainreport.com, you will see that if you get caught with an amp, the FCC will most likely give you a warning first. If they catch you again you will receive a fine of several thousand dollars. There are a couple cases where the abuse was so bad they bypassed the warning letter and slammed the operator with the maximum fine. The equipment is seized and destroyed. If you refuse an inspection, that is a seperate violation, and the fine is higher. Anyone planning on violating FCC regs should really discuss the issues with an attorney.

You have three choices as I see it:
1.) Improve your antenna system with a 1/4 wave whip.
2.) Increase your output power via an amplifier.
3.) Both 1 & 2...

LMAO! Richard that was pretty funny :^)

But overall correct, I doubt there could be a radio
that would reject 6k only 300 yards away. If it
did, it would probably be the best selling rig in
the world.

I hate to tell you that the Bird wattmeter is only a "standard" on CB.
We use them at work but they are most inaccurate from my experience.
They claim to be 5% tolerance but in reality... some of the slugs may be
closer to 10%.
I use a real wattmeter, an Agilent E4418B that's about 2% accurate. It
rocks!
--

What is the price on an "Agilent"? An Autek meter is close to what you
claim and probably way cheaper.

end of it all, there has been nothing in the local media because they do not want it in there. There is an investigation going on, don't want to scare the rats away from the trap.
But I doubt that this is the real twist, and that I have probably fallen for another troll, however a clever one, because the prose doesn't look like twists writing.
Keith
-
Hehehe..I had to tone it down, Keith. My loyal followers were having problems keeping up with the comprehensive aspect. I was gone for 3 weeks and the usual guilty parties were still howling about my long lasting impressions the chip in their tiny brains won't let them forget. An investigation, no matter how secret, would have been spurred by an original complaint or complaints, whether written or called in, which would be a matter of public record before an investigation began and is subject to the freedom of information act. A simple complaint to the sheriff's office can not be retroactively sealed from the public without a judges order, and if a judges order was handed down, it too would be accessible in the public record. along with the reason why it was sealed. It happens all the time with gag orders on the media during large profile trials, but the order is still on record along with the judges name.

I'm looking to find the audio amplifier in this radio. There is no audio in or out of the unit, so I am assuming the amplifier is the problem.. My problem, however, is that the typical audio amplifier package is not used in this radio. I have no schematics or anything like that to go by, so I am having a hell of a time trying to find it

Here is a list of the transistors I can see in the unit that are heatsink mounted...

C1760 - Believe to be the driver? Close to what I believe is the final...
C1239 - Final?
C1096 - Two of these mounted to the same heatsink right next to each other...

I'm guessing the Two C1096's some how comprise the audio amp(s), though I'm not sure..

Anyone have any ideas? Perhaps a suggestion as to what could be wrong?

History: Owner was listening to the unit, and a nearby radio keyed up (possibly powered); then nothing... Nothing in, nothing out..

Thanks!
PH

Jerry:
DID you ever hear of the EIA ? Shouldn't we have PRIVATE (EIA) control of the spectrum instead of Govt. control (6th plank)? Because I am Constitutional, you call me an anarchist. I am NOT an anarchist, but commies seem to think that if things don't go their way (the manifesto), it's time for name calling! Like a little boy once said of ceasar, "That man is DEAD." We didn't have it in the 20's, right? We don't need it now. A private alternative would be more Constitutioonal and less communistic! Dave!!!!!!!!!!!!!!!!!!!!!!!!!

I will. Since 9/11/01 many frequencies that have gone unused for a long time
around the NYC area are now in use. Also interference that may have gone
largely unnoticed may no longer be unnoticed. Both "Pop Com" and "Monitoring
Times" have both reported the huge increase in communication traffic since
9/11, much of it on frequencies that had seen little to no use until that
date.

I have to agree with you. The mfg's seem to be thinking that way as well, I noticed that they are offering 10 and 12 meter radios, perfect to span the range of 24-30 mhz.

25 mhz will open before and close after 26 -28 mhz will, this will allow for more dxing time.

If you are more interested in local communication I think the 29.7 to 30 mhz range just above the ten meter ham band is a good place to go. Operate FM up there with tone squelch or ssb if you need a little more distance.

That's an insult, how dare they not post such articles. I remember in the late 70's and the early 80's 73 magazine carried mods for just about every single chicken band radio of any significance.

The average ham sits around with his mike in one hand, his cock in the other, and kerchunks the local repeater all day while jacking off.

Sorry, that's just the way it is. The tests are so easy, they're meaningless, the hobby is going down the tubes, fast.

The freebanders will become the real hams within a few years.

The average no-coder has the intelligence of a fart. A no-coder buys his two meter hand held, takes it out of the box, and talks. A cellular phone user does the same thing. What's the difference? The cell phone user actually gets quality communications.

These new no coders are nothing but cellular phone user wanna bees. They can't afford the monthly rate of a cell phone, and their trailer park doesn't allow external antennas so they use their little two meter hand held jackoff box.

We've got to get those damned truck drivers off the cb. Trucks suck,
and truckers suck even worse.

The average truck driver is even dumber than a no-code technician, and
I didn't think that was possible.

The average trucker smells like a pile of crap because he bathes maybe
once a year at most.

We need to pass a law making it illegal for truckers to use two way
radio's of any kind. No antenna on the trucks, no radios in the
trucks.

Trucks and truckers are a menace.

===

Hi Karl.

It works in earlier versions too... I use OE 5.
Many of us have already blocked the Trolls, but some just keep changing the e-mail addy in their header. As OE blocks by e-mail address, they get through, and you must block them over and over again.

Now and then, it can help to clean out the old addresses that are no longer used. The larger the blocked sender list, the slower OE downloads messages.

Brainbuster.

Hi Train.

It's listed as an "MS 119 Direction finding antenna", but it is possible that other manufacturers did a version of it. Hell, the "MS 119" may have been just a cheap copy of a better antenna.

There are also manufacturers who will sell a product under several different trading names, and some who churn out products for everyone else to put their "Brand" name on.
I have worked for such companies... if you mention their name, everyone says "WHO??", but chances are they may have some of their products sat in their home or workplace with another brand name on them.

Brainbuster.

> No the AKC are advocates of legal CB, You and your type see this as a
> disruption of your Illegal CB behavior.
===

No, you see anyone who disagrees with your childish and abusive tactics
as being "his type"... what you call a "Keyclown".

===
> They are dirupting your right to be illegal right?
> Is that what makes you mad? What do you call your faction?
===

They are disrupting everyones right to use this newsgroup. Many who are
against your tactics actually agree with legal use.

You have already given a name, but you apply it to anyone who disagrees
with your tactics... which is everyone except "akc" members.

===
> > now that you've seen it did not work and we are not leaving and that
> > some of the unscruplulous within us are willing to give tit for tat your
> > running scared.
>
> What has not worked Tim? and who wants you to leave? Isn't Landshark
> advocating complaints to ISP's. Seems you guys want anyone against Illegal
> CB to leave more than they want you and your gang to leave.
===

Do you remember when I told "Roger Beep" that with a linear, he could "stamp"
on people he cannot even hear... because he asked about that issue.
How about when I told someone that they do NOT need a linear... because they
asked, and needed straight facts for their situation.

Who tried to make me leave the group... exactly, nobody. I even got
agreement from one of those you consider a "Keyclown", and nobody gave
him grief either.

I even clearly admit that I run a legal *4 Watt* CB... but that's my
choice. But, if running a legal setup for too long means that you end up

acting like an a$$hole... I had better go out and get the biggest linear I can find, just to be safe.

It's not the message that is hated, it's the "akc" attitude.

===
> You and your bunch are trying to silence critics of Illegal Op's. Why?
===

Wot, we have no right to use our killfiles?
If you really don't get it... then get another brain cell, and then read the above again, it really is quite simple.

NOTE: The above is rhetorical... you are killfiled under that name also. Although I suspect the "akc" rules don't allow this, and they think they own this newsgroup.

Brainbuster.

If brains were taxed, he'd get a rebate.

Source record: 111638

Poor Dave,
Yes, we didn't have "much" control in the 1920s. There was also chaos because anybody could, and did, fire up a radio station and broadcast or communicate away. The problem with private control is that private interests can't enter into treaties with other countries. In the case of controlling radio spectrum, the need should be obvious for centralized control of spectrum to insure that the regulations are even-handed. I can also see how "private" control could easily become corrupted with under-the-table deals between the "controlling" private agency, whereas in the USA, Congress, (remember that ELECTED body?) oversees the Federal agency that was created by the Communications Act of 1934. If enough people want FCC to do something, and their pleas are ignored, they can go to Congress to force their will upon that agency. That is what caused the so-called "local enforcement" bill to pass. Of course, this bill hasn't exactly set the woods on fire with Bubba sheriff bustin' folks, but the point I am making is that we are NOT communist and our government is not communist.

You keep ranting about ANY government regulation being communist (at least that's how you come across), yet we have more access to radio spectrum than many other countries. Are you aware that, in Britain, one has to have a license to own a television--a LICENSE to watch TV in your own home. Now Britain certainly isn't communist--more socialist than we are--but if we really were in a communist country, your CB shop, your products, and your ability to use a radio would shortly be curtailed, seized, fined, whatever. Totalitarian governments operate under a fear of their people because they know as well as anybody that, given a chance, the people would rise up against the iron-fisted tyrants. Yet, you here in the best country on earth can go down to the local Wally World, purchase a CB or a scanner, go home and talk or listen away. Yet you still have this "fear" of the government that WE the PEOPLE elected! You insult the intelligence of the American people, Congress, and our President by slinging labels based, mostly, on a single issue: the fact that you can't just grab a radio, fire up with a gadzillion

watts on 7.255 and jabber away, or you can't chat with the local police dispatcher on 155.890. Those laws are designed to PROTECT people's rights while allowing as many people as possible to enjoy a slice of the radio pie. And you call THAT communistic? I don't
THINK so.

So why, Dave, can't you "render unto Ceasar that which is Ceasar's, and to God that which is
God's?" No government is perfect because it is made up of imperfect people, but we DO try.
"Ceasar" (in our case, a representative republic) is necessary to protect the people from enemies, both foreign and domestic, reward the good, and punish evil. That's why we have laws. I, too, think some of them are silly and overly restrictive--like, for example, seatbelt laws.
I wear my seatbelt regularly, fastening up without thinking. But I DO NOT like the idea of it being a law that I HAVE to do it. But over all, I believe in our government and its policies.
AND I believe in the rules and regulations that govern radio. Without them, most of my efforts
to use radio for personal, hobby, and emergency services would be in vain because, in spite of
my assumed knowledge of HOW to operate in a way that minimizes interference to others, I simply couldn't compete with a loudmouth hollering on 26 MHZ (yes I am licensed there as well
as well as others), "Break, skipland" with a 15 KW amp (never mind that he's probably frying
his brain with all that RF). Can you digest all this, or are you still digging out from under all those "planks"? LOL

I
> produce!

Now here is the $64K question. What is the radiation efficiency of your antenna on the different bands? I see these antennas, screw driver type, for sale all over the place but nobody ever seems to publish any figures about how efficient they are. I know on the low bands most of the power is spent heating up the loading coil, and I wouldn't be suprised to hear the antenna is around 10 percent efficient more or less on lets say for example 80/75 meters. I know the main secret to these antennas is how high a "Q" you can make the matching loading coil for good efficiency.

Note:

Total Power Radiated
Eff=------------------------- X 100
Total Input Power

Careful, Brains, you are treading in a minefield. Not only are you out there on an issue that split the Church several times, it would seem that you have taken more the Orthodox position than the Western Catholic one. Does the point of the triangle point up or down? Of little things are schisms made.

The King James, to the extent it was not lifted bodily from the Geneva Bible, largely is based on Erasmus Greek Bible which in turn translates back into Greek a lot of Jerome's Vulgate. There are existent today a number of manuscripts that take us well back into the early centuries, none of which were available to James group of scholars. For all that they did not do a bad job; it suffers today more from being in the English of Shakespeare than it does from mistranslation. Some of the mistranslations are repeated in the Book of Mormon.

Read Romans and you get the feeling that Paul not only believed that the Creator and Jesus were separate, they each had their own spirit. The Word thing has echoes of the Gnostic which is probably why John was written in the first place. Johnine writings are second only to the Trinity for good arguments.

And I spent a good part of the morning dreading the appearance of the Watchtower Bible and Tract Society. If Hell to an American car enthusiast is eternity in a 1978 Ford Fairmount, for anyone with an interest in Christianity, Hell must be eternity reading bad phamplets.

It will also "inspire" the FCC to band those same rigs from importation, in which case it will be "inspiring" to see them get dumped by the truck load in to the local scrap yard's car crusher for disposal, when found by US customs officials. There has been talk for some time about this, and any further illegal expansion of CB operators outside of the "legal 40" may be just the straw to break the FCC's back, and get them to do the above.

Of course there is also some movement requiring one to produce a "license" before buying a rig too. I've seen this happening more and more at Hamfests. It's amazing how many Hams really keep a copy of their license on their person where ever they go. I do. I have a copy in my wallet at all times. It's fun to watch the guys walking back to their pickup trucks, with only the big K40's on them, with nothing more than a roll of coax, coax connectors, and a bad attitude when somebody asked for a license they can't produce because they don't have one.

I was on one board and the owner just got a radio that covers from the low 24 MHz range (something like 24.2) up to the high 29 MHz range (something around 29.6). Over 27.999 causes a lot of problems, other areas are reserved; a better question might be what does one use for an antenna that covers such a range? A log periodic would do, but they are expensive, bulky, and SWR will be over 2 to 1 in many areas. Another would be a large discone instead of a vertical or a biconical (an interesting device to support) instead of a dipole. Or a tuner, assuming reasonably low loss coax, a reasonable short length of coax, and an antenna cut for the middle (since the actual SWR will be getting pretty high at the ends). Of course, one could use perhaps two or three antennas, each cut for a different area; then again an old Heathkit Cantenna will supply a 1 to 1 swr (or reasonable facimile thereof) over the whole range.

How do you figure. I gave a point of reference. You stated that all
points of reference agree. I chose to disagree, and pointed out that
they only follow close, not in agreement.

Again, please explain HOW that is nitpicking?

No, legal limit is 1500 watts for what I was talking about.

You said that someone getting 750 watts out of his amplifier
will have to suffer from cataracts and sterilization.

Legal limit for the amateur community is 1500 watts.

How is this hard to follow. Someone using half the power
in a closely related service will have sterility and cataracts,
but someone using TWICE the power in another (closely
related) service won't?

Seems like that whole Bird wattmeter Vs. other wattmeters again,
doesn't it.

I fear little to nobody. Piss someone off? If it pisses them off, let me
know.

If I can fix the problem, I do.

If the problem is on their end, I offer to help them fix it.

Instead of sitting here bitching, bringing up problems that less than half
of the
people I have run across have been presented with.

Of course, you don't actually DO this, your only speaking textbook, and how
things are PERCEIVED, not reality, correct?

Or do you operate high power, overvolted equipment?

>

> >
> >So does amateur contesting, but we have been through that already.
>
> Are amateur contests legal? Do they adversely affect non-participants?

Yes. Look at the amps radio reflector, and see all the foreign and
local stations bitching about the extremely wide signals some of the
us and italian stations put out.

Then see the retorts, of "That's how I make sure that nobody is
sitting next to my call frequency".

Don't act like other people don't have the same problems, or compounded
because of other services similiar acts.

> If so, how many as compared to your splatter-box circle-jerks?

Since it is a problem worldwide with the contesters, I would seemingly make
it a BIGGER priority (as did the FCC, by installing Hollingsworth :))

Don't throw stones when your living in the glass house yourself.

> They hadn't even pulled all the bodies out of the Pentagon when that
> happened!

I thought the DC break was cancelled or moved?

Even so, how does that desecrate those who died? Because people went on
with
their lives?

I tell you what. When I die, make sure you people ALL get on with your day
to day
routine. Don't take time out, don't take time to ponder, just get on with
life.

If I die in a terrorist commanded plane, GET BACK ON ANOTHER PLANE. Don't
let them win, scare us into submission, etc. JUST GET ON WITH LIFE!

>
> >We don't trounce on you,
>
> More bullshit! The whole point of these "contests" is to trounce on
> other people's signals.

Actually, it isn't. The whole point of the contest is to see who can put
out the strongest signal. If it was to trounce, wouldn't you think that all
stations would key together, instead of the elimination system they run?

Wait, that doesn't fit into YOUR modus operandi for what WE do, so it
must not be true.

Again, please tell us if you are part of it, or a bystander who knows little
to
nothing else, other than what the other anti-keydowners tell you.

Your amps don't discriminate who gets stepped
> on, and after listening to a few of these keydowns, they enjoy the
> fact that they are jamming the channels! You are full of it, toll!

You listened to a few of them? Which ones. What where the outcomes.

Yes, I am calling you a liar.

Please show me which ones used common local calling channels to hold their
keydowns on.

Again, your proving yourself either an idiot or a liar.

>
> > I suggest you stop attempting to tell us we are

> >we are going to try it anyway".
>
> >After all, if we all listened to the forefathers, Europe would be a
CROWDED
> >place!
>
> Where do you get off trying to tell me anything about patriotism?

Had nothing to do with patriotism. Had to do with the people back in Spain
telling us that the world was flat, and if Christopher really did sail, he
would never
be heard from again.

The
> good people that founded this country fought and died for the freedoms
> you take pride in abusing,

How do I abuse my freedoms? Please explain that one.

and they created the government you shit on
> every time you do one of these "contests"! You are one fucked up
> individual!

Yup, I am. And if this is what classifies me as "fucked up", and your not in the "fucked up" category, I figure I am living my life fairly well.

I give people liberty to do what they want. You attempt to take it away.

I give people the knowledge to know what they do is wrong, or that they are going about it in the wrong way.

You just tell everyone they are wrong, fabricate things, and then go on your merry way.

Have a nice day. You made mine.

Actually, the Bird, as a standard is Mil-Spec.

I use a non-inductive load and a ammeter to calibrate.

It is more accurate than most.

And you don't use this at home, you use it at work.

And ALL your slugs will be advertised tolerance if properly taken care of...
Which few people do.

It's only all steel because Eimac stopped production of glass a few years ago.

People are STILL buying the 4- and 3- tubes. Only now they are either pulls, NOS, or from Russia, with love.

(or China, as RF Parts imports them).

I still get calls for people wanting glass. I still build them. Steel is big numbers, thats all.

So what is your excuse Tim? Can't pass the so-called simple test? And just
for the record, since you're clueless as usual, it's more than a 10 question
test. If you're tired of looking like Twisted, shooting off at the mouth
before engaging your brain, you need to look up your facts first.

>I'm guessing the Two C1096's some how comprise the audio amp(s), though I'm
>not sure..

Push-pull through the audio transformer, but you are assuming that the
problem lies in a power transistor. Your problem could be a preamp,
the audio power amp, the transformer, the power supply, or even the
relay that switches the PA output from the speaker to the RF final. It
could be an open or shorted transistor, a shorted cap, a blown winding
in the transformer, a bad relay contact, a bad solder joint,... get
the idea?

>Anyone have any ideas? Perhaps a suggestion as to what could be wrong?

If you are not familiar with identifying circuit functions on the
board, then you need to find a schematic and troubleshoot.

>History: Owner was listening to the unit, and a nearby radio keyed up
>(possibly powered); then nothing... Nothing in, nothing out..

Great testimonial!

Do you need a refresher? I asked what a "bird watt" was, you claimed
that a "Bird" was the "de facto standard", which it is not. The Birds
are no more accurate than most any other wattmeter. If they are not
calibrated, both will show bad readings. But the differences are
insignificant, yet you claim they are. It is -you- that should explain
why -you- think there is such a significant difference to make your
claim.

The topic was keydowns. Are you trying to change the subject?

>You said that someone getting 750 watts out of his amplifier
>will have to suffer from cataracts and sterilization.

If they don't have enough brains to keep the RF away from their face
and balls, yes! How many of them check for power on the coax? How many
of them can tell the difference between power on the coax and power
from the antenna? Not many. Care to take a guess as to how much RF
comes off a vehicle chassis?

>Legal limit for the amateur community is 1500 watts.

>doesn't it.

Not at all. Again, we were talking about illegal contests, not amateur
operators, so why you want to compare the two I don't know. But what
the hell, right? The amateurs have a couple rules of thumb: Use the
least amount of power to talk; and, use good engineering practices.
Keyclowns do neither, so the two cannot be compared. "Que sera sera".

It was a lot worse before they required the nets. Remember seeing the
films of carnage from the old NASCAR races before their safety rules?
And you know how the FAA works, right? It's called graveyard
regulation -- rules aren't made until enough people die.

You sure have a short memory. Wait, you don't need a memory because
it's all printed above: "They are held in usually isolated areas..."
And where did I say that it desecrated anybody? But knowing it causes
radio interference, wouldn't it have been a good idea to move it to a
more "isolated" area instead of the middle of a crisis situation?

What's the difference? 50,000 or 500,000 watts, it's all irrelevant
when the legal limit is 4!!!. Do you know how much of that gets out in
harmonics? Do you care?

I didn't think so. That's the problem: Nobody seems to care about
anything but their own petty, spoiled perversions. You are no
different. You aren't worth any more time, and you aren't even making
any new arguments, just distorting old ones. Go ahead and distort this
all you want with the assurance that I won't respond, because I won't.

Unless the complaint was made BY the SO or police.
They do not file reports when doing internal investigations.
Keith
-
This is correct, SOMETIMES. Reports are filed..by internal affairs. If it is an internal investigation, it means one of their own is being investigated. Are you saying a cop is causing interference and havoc on a cb?

Source record: 111574

From: j.r.hampton@worldnet.att.net (JAMES HAMPTON)
I was on one board and the owner just got a radio that covers from the low 24 MHz range (something like 24.2) up to the high 29 MHz range (something around 29.6). Over 27.999 causes a lot of problems, other areas are reserved; a better question might be what does one use for an antenna that covers such a range? A log periodic would do, but they are expensive, bulky, and SWR will be over 2 to 1 in many areas. Another would be a large discone instead of a vertical or a biconical (an interesting device to support) instead of a dipole. Or a tuner..

-
Bingo.

1336. RCI-2950DX HELP!!!!

On this radio if you want to display channel #s instead of frequency readout you press the "MAN" button. Problem is that when you do so it automatically jumps to channel 9 regardless of what channel you were on prior to pressing the "MAN" button. This is very annoying to me. What I would prefer is that if I'm on 27.405 and press the "MAN" button, for it to read channel 40 not jump to "9". Is there any way to disable this automatic channel 9 select on the "MAN" button? Please help before I take a hammer to it!!!

Thanks,
LJ

Very cool, Jerry. The wealth of information on this group is very great indeed. I must confess, an email in my box was waiting for me when I came home and it was a forward of a post by you in another group talking of this antenna. I figured if you wanted it mentioned in this group you would get around to it. Now what I want to know, is how much to fry it? What was the most you pumped through it or personally witnessed sizzling through it's beefed up guts? Be sure to include any second hand accounts, also <g>.

No Balls buster, My header hasnt changed at all as it shows every post that I make comes from @home, and I am allowed to use any User name I want to remember I live in free country. Keep grasping for straws. Remember your boyfriend Landwhale he has contacted my ISP crying like a little girl and after the nice conversation me and the abuse team had they said I can continue as I have been.

I dont see Tim doing that, or others for that matter (apart from one who
does
> it to distinguish his posts from the "akc" forging him, and Sparky is now
> doing it... but then isn't he one of your crew?)

You had better open your eyes then, and if so then hey I am trying to distinguish my posts from Landsharks attempts at forging me. But we all know It's ok for him to do and no one else right thats your hypocritical nature. Do you have prood the AKC is forging him? Whats your address I want to send you a hankie to cry in.

> I saw that name on the "qrz" web site.
> ROTFLMAO... is that name for real?

I don't know is it for real youll have to ask Phil C he is the one who started calling me george

> Is that a yes, or no?
> Have you considered a career in politics?

What do you care?

> What register... please don't tell me that you guys actually have a
> "register", meetings, club nights... etc.

Again what do you care about a register? Ok I won't tell if you don't tell about your gay mens club old chap!

> No, you see anyone who disagrees with your childish and abusive tactics
> as being "his type"... what you call a "Keyclown".

Your wrong NoBalls Buster, my tactics are no different than twistedhed or Landwhale or Train or Mopars, or Tim or your whole group of merry men. Keyclowns are illegal CB activists.

> They are disrupting everyones right to use this newsgroup. Many who are
> against your tactics actually agree with legal use.

So is Twistedhed so is Landwhale so are you Your trolling right Now No Balls Buster looking to get a rise ofut of someone arent you? If not then why did you need to defend Tim, This post had nothing to do with you or even a mention of you. So No you are a Troll in every sense of the word. If it looks like a troll...

> Do you remember when I told "Roger Beep" that with a linear, he could
"stamp"
> on people he cannot even hear... because he asked about that issue.

No I don't sorry Your Point?

> How about when I told someone that they do NOT need a linear... because
they
> asked, and needed straight facts for their situation.

No I don't sorry Your Point?

> Who tried to make me leave the group... exactly, nobody. I even got
> agreement from one of those you consider a "Keyclown", and nobody gave
> him grief either.

Your Landsharks butt buddie why would they ask you to leave the group remember he is cool.

> I even clearly admit that I run a legal *4 Watt* CB...

Ohh arent you special.

>but that's my choice.

Same as it is my choice you don't like it don't read my post better yet don't reply to my posts

But, if running a legal setup for too long means that you end up
> acting like an a$$hole... I had better go out and get the biggest linear I
> can find, just to be safe.

Yeah ok

> It's not the message that is hated, it's the "akc" attitude.

I say the same for the Illegals, its there attitude that is hated they can break laws and fear no reprisal and the hell with who ever it bothers, the hell with who ever gets in the way because we are huigh and mighty Keyclowns. So your right I guess they do hate the AKC attitude it's the legal attitude they don't like.

> Wot, we have no right to use our killfiles?

Use your kill file whats stopping you I know what it is you want to reply to me your a TROLL but you will reply to me Landwhale crys about how I am killfiled yet replys to my posts thru others . Why? TROLLING

> If you really don't get it... then get another brain cell, and then read
> the above again, it really is quite simple.

I get it a few times a week I am sure you do to but up the ass don't count. Listen Balls Don't reply to my posts ever again. Thats the most effective killfile, lets see how much fortitude you got. If not we will see the real you a Troll for all seasons Now get lost Boy!

oh good grief leland.....lighten up......tell me.....

I will. Since 9/11/01 many frequencies that have gone unused for a long
time around the NYC area are now in use. Also interference that may have
gone largely unnoticed may no longer be unnoticed. Both "Pop Com" and
"Monitoring Times" have both reported the huge increase in communication
traffic since 9/11, much of it on frequencies that had seen little to no
use until that date.
--
Leland C. Scott
KC8LD0
-
Pop Comm? Isn't that the same magazine you chided and derailed as having
no reponsibility or journalistic integrity? Why, I believe it is so. Yet
here you are (mis) quoting it and attempting to misapply what was
written in order to make it appear as if it somehow parallels your
laughable comments concerning cb near NYC.
You attack something, then embrace it. I see a pattern here.

To receive them buy a scanner. To transmit on them, get a ham license.

Change the coax if it's three years old. Moisture has most
likely invaded the dielectric. Use plenty of Coax-Seal.

Welcome to the newsgroup; you'll not find Miss Manners hanging around here!
Check Scott (Unit-69)'s post - he might be on to something with the coax.
Certainly one would expect more than a lousy mile from a stock rig (and you
might even make a mile using a dummy load!).

73 from Rochester, NY
Jim

Hello Middlefinger4,

or whatever
you're calling your self this time.

I figured since you have so many
aliases one of them will probably be
able to receive email, and you might
even read this in the next week.

If so, be warned. I have an Uncle
who is an attorney and his advice to me
is to state categorically that I will
not tolerate harassment.

Somehow you know I am Mark Beck
of Freemont, CA. This is knowledge you
could only have gotten by illegal means.
I can prove this, and that means I have got
you by the short hairs little buddy.
```

So my offer to you is to cease your childish banter in the newsgroup and stop contradicting me and annoying me every time I post. In return, I will not press charges.

Oh yeah, if you try and bring this up in the newsgroup I will deny it.

Landshark

Well, channel two runs from 54 to 60 MHz. You can receive this by setting your television to channel two. Channel three commences at 60 and runs to 66. There are various sundry breaks in this scheme and UHF is another matter; however they all are 6 MHz wide. :-)

Just a quick note to point out that no antenna is very efficient when they're only around 7 feet long attached to a couple thousand pounds of metal which is very short compared to a quarter wave on 75 meters. I'd be surprised if they were as much as 10% efficient down there. Loops might be a bit more efficient - except you will be coupling to that big chunk of metal with your h-field. Just a guess, but once you go below 20 meters, efficiency on almost any antenna mounted on a vehicle will get pretty low.

^ What better way to heat the radio room at night than with some
^ warm tubes just a glowing and a throwing off some heat,

Absolutely, my small "shack" is kept warm by the heat from a couple of
tubes.
Great thing is that they even give off heat on standby, with no signal
in.

Of course, I wont say what they are used on... but they aint used for
Ham
Radio.

Brainbuster.

>Dave!

My Bird does both, but Bird isn't the only company that makes a peak
reading wattmeter. I should point out that if you want to include all
the harmonics and splatter in with the output power, a peak reading
wattmeter is the way to go. If you want an accurate measure of carrier
power, however, an RMS meter is what to use for AM. A lot of keyclowns
don't like RMS meters because the little needle doesn't move and they
can't figure out how to use a modulation meter. Gotta have that swang!

One benchmark of their efficiency and success is their popularity in the Amateur community.
I can give you a "Q" value of my loading coils which approaches 300.

NO mobile antenna is efficient when compared to the standard benchmark of a 1/2 wave dipole. After all, on 75 meters you are compressing 120-odd feet of antenna into 9 feet or
so. However as screwdriver antennas go, they are surprisingly successful on the low bands.

Let's take it down to where other non-tech readers can follow the thread. Suppose you turn on
a garden hose without a nozzle and just let it run. The water does so easily enough. What happens when you stop up the end with your thumb? The pressure in the hose increases. Taking that principle to an HF antenna, if you have a "skinny" form, tiny wire wound closely around that form, much energy IS lost as heat. An example would be the hamstick which, on
40 and 75 meters is almost a dummy-load-on-a-stick. All those little electrons are having elec-
tronic "road rage" as they jostle around in there trying to make their way out to the tip of the antenna. So, you do have signal lost as heat. Now, take a large inductor (2" or more) wound
with large (#14 or more) wire at, say, 8 TPI, you have created a superhighway that can handle
more traffic! In simplistic terms, the little electrons (RF) can cruise on up the antenna and launch on their way. That also creates another little problem. The total resistance in the antenna now drops to a value less than that which the transmitter likes to see (50 ohms) measured at the feedpoint--especially when operating below about 8-10 MHZ. So, we have to add some impedance (a measure of resistance in easy terms) back at the feedpoint in the form of a capacitor, a shunt coil, or a toroid. The feedpoint impedance of an efficient HF an-
tenna will drop to about 12-17 ohms. The total resistance of the system will be the sum of this
impedance, loading coil resistance, and radiation resistance. So this little device we add makes up the difference. As one goes higher in frequency, the total resistances tend to rise until
it equals around 50 ohms--which is why one doesn't often see impedance matching devices on
11 meter antennas.

I CAN give you a heads up to listen out for the California antenna "shootouts" (No, it's not like
a keydown) that take place about once a month. You may find a blurb about on QRZ or in the

mags. I have seen the results in QST in times past. To basically answer your questions about
the screwdriver antenna, most of the screwdrivers come in very near the top of the heap in these trials. One main reason for this is it's very design. Because the screwdriver antenna IS, in
most cases, a VERY efficient antenna and can be infinitely tuned for whatever surroundings it
happens to be in. it is always resonant (assuming the operator knows what he's doing). The SWR will normally be 1.2-1 average. Contrary to what people believe, efficient antennas are
NARROW banded. Because of that, the more efficient the antenna, the more it is affected by
its surroundings (trucks, cars, vans, water tanks, cell towers, etc. will often de-tune them). IF
an antenna is fixed-tuned via wander leads, taps, etc., when this occurs while motoring down
the road, you are just out of luck--maybe even losing that rare DX contact you were in QSO
with. With the screwdriver, if you find that the antenna is de-tuned, you simply jog the control
switch and you're back in tune in seconds. The large lower mast, necessary to house the motor
and drive assembly, appears to improve the antenna's current distribution as well due to its mass. The overall result is that, assuming that conditions will support communications at all, if
you can hear them, you can work 'em. Like so many other kinds of antennas and their mfrs, there are many variations in size, style, tuning methods, and effectiveness. Generally, the un-
written rule on the lower HF bands is Ya gotta have a BIG UGLY antenna for the best signal---it's the nature of the beast. I have a Carolina Cyclone II on my Lumina. It has a 3" diameter
coil and causes the truckers to do a double take on the Interstate! LOL! But I can work all
Amateur HF bands, Fema, USAF, and CAP with a reliable,and often loud, signal.

The screwdriver design is still evolving. Accessory manufacturers are offering semi-auto and
fully-automatic tuning for the type of antenna. IOW, AmCom (the ClearSpeech guys) offers
a controller that is aimed particularly at people with IC706s and rigs with auto-tune buttons on
the panel. Once installed, one sets the frequency on the rig and presses "tune" on the rig, and
the antenna travels until the unit detects lowest SWR. If it "misses" the best place in its search,
it reverses travel until it finds it! Once that is done, the controller goes to "sleep". Nothing else
is needed-the rig automatically resumes the operate mode. Pretty neat, huh?

While I have no facts and figures, I know from experience what they will do.
They aren't all over the ham websites for nothing!

I hope this answers some of your quesitons.

This issue was discussed last year at the Shelby hamfest. Their door prizes used to be given
to ANY ticketholder, ham or not. It was pointed out that it should be that one would have to produce a ham ticket to win a radio. Non-hams would win the equivilent cash prize. They could, of course, win computers, software, and non-transmitting equipment. I hope this policy
is in place for the 2002 Shelby hamfest.

I know what you mean about people stomping off in a huff. Couple of years ago, I had an amp
for sale on my table. I priced it and also stated that a valid ham license would be required to
purchase. A rather scruffy gent came up while I was helping someone else, looked the amp
over, and stomped off just a-cussing because he couldn't buy that 'ere %^$#@*&^ "leenyar".

LOL!

But, Jim,

You do realize that one of the "features" on those CB antennas in the
truckstops is "broad-
bandedness". Lots of folks think that is an asset. The mfrs play upon that
misconception.
amd build in enough loss to acheive what the customer wants! LOL!

Sparky,

I am sitting here snickering over your original post. I can't help it, I've always giggled at this
"bird" watt stuff. There are lots of Peak Reading Wattmeters--like my Swan WM2000A I've
had for nearly 20 years. Hehe! What's a "sideband" watt, or a "peak meter" watt, or an AM
watt? LOL! A watt is a watt is a watt is a
watt..... It's just TOO funny.
Trying to tell "some" folks that a properly modulated AM carrier won't "swang" all that much
is useless--it's all what you measure it with! <g>

OH, I gotta go take my "pill" (Loud GUFFAW) Sorry, Sparky. I couldn't resist that.

Jerry

Does anyone know just how far the local zoning officer can go with dumb ordinances involving antenna heighth and proximity to property lines, ect? Our local ordinance says an antenna mounted on the ground can't be above 15 feet high, but a roof mount can be up to 20 feet above the highest point of the roof. I have mine on a 30 foot tower anchored to the gable of the roof. I also have a ground plane on the other side of the house that's close to the FCC limit of 70 feet. Do these local ordinances overrule the FCC? Where can I get the definitive answers to the questions I need to ask? Any help you could provide would be greatly appreciated. I also should mention that he said I could have only one antenna. Has anyone ever heard of this? Is this enforcable? I might just give him what he wants and take the one down and change the dual polarity to a five element flatsider right about the height of the telephone lines and tell him to go @#$% himself. Thanks for any help you can give me with this problem.

Larry,
The place to look is in the files of the 'codes' department
at city hall. Take a look at their 'codes' books, see what the
ordinance actually says. I have a feeling that that isn't the
answer you were looking for, but that's where you'll find out.

Well the absolute best thing to do is to tune for the most reflected power.
This means the rf will reflect off of your vehicle really good and get way up
in the stratouscatousphere.

hmmmm,
now that is definitely the truth.
out here in scottsdale arizona during the last hamfest, I whitnessed a
lot of this going on. if you didn't have the "ticket" you didn't get the
rig (regardless of the $$$ they had on hand)..

Had that happen to me more than once and boy am I gald I had my "wallet
copy" with me too!. even got a discout from the ham selling to me because
I had the license on my person. :)

An IP address is assigned each time a user hooks up. This address will
most likely change for every hook up. Therefore you can not block a
user with a IP address block.

Greetings!

Although this might be a late entry - the concept of the VHF and UHF antennas arise from the shorter wavelengths allow for less material and stress for these high-gain designs.

They can also be applied to other, longer, wavelengths, only now the spacing and matching lengths are quite larger.

Attempting to put this in a practical antenna array for 11 meters, the required mass of metal and the sheer weight would pose some serious design considerations. "10-8 and standing straight" means more than having a gift subscription to a Smut rag.

It's not impossible, just impractical; due to the area needed to be cleared of trees, powerlines, small dogs, large buildings, playgrounds, FAA height restrictions, 1-800-MISS-DIG to mark out "no zones", DEQ variances and habitat allowances [See Sparkys tips on Bird Wattings]. Let alone the expense of foundry workers needing to melt the ores to generate the alloys, then the manufacturer to take the raw product and put it into tubing and other supports to make the elements. Reminding themselves to "measure at least twice, but cut only once." - the sheer tonnage of concrete, pipe and wire needed to root that sucker into the soil could also be used to make a Hydroelectric dam to power a small third world country. Well, maybe enough to supply power for the welders putting this all together at the factory. Just imagine the questions that are raised as such an undertaking [lack of a better word].

All for the sake of putting it together in a kit. Ever try to fold a map? The assembly instruction sheet could be a monster!

God bless the hapless soul that stumbled onto that deal, as well as the UPS driver that has to "drop ship" the metallic mess into the front yard of the enthusiast.

Did anyone bother to ask "Do you think my neighbor would mind?"

Try to placate thy ruminant occupier of the "space next door" of the asthenic of shade, free light power, and a talking refrigerator, just to name a few...

Actually, the term "bird watt" came about as a sort of "my meter is
better than yours" mentality.
One of the most competative aspects of the power hungry set, is getting
the most power out of their setups. In the beginning there were people
getting wild and crazy wattage readings (See: "Dosy watts") from their
less than commercial grade wattmeters. Pandamonium ensued as every
different person tried to defend their wattage readings from their Radio
Shack, Dosy, and the plethora of other CB-type wattmeters. Soon people
discovered that the Bird meter was a commercial grade meter and
calibrated for better accuracy than the typical "CB meter". The guy with
the bird meter was often called upon to settle the dispute in wattage
readings, between rival's other wattmeters. So when someone says that
they are putting out 1000 "Bird" watts, it's their way of saying that

this is an accurate 1000 watts, as opposed to 1000 "Dosy" watts (Which could be anything from 500 to 1500 watts).

Of course, for a bird meter to operate accurately, certain conditions have to be met. SWR, and spectral purity are the biggest factors. So it is possible for even a Bird meter to be grossly inaccurate, if not used properly.

> steady as a rock.

The key term here is "properly". Someone who has modified his radio with
a "swing kit" will have an asymetrically modulated waveform, and will
show some forward "swing" even on an RMS meter, although not nearly the
same ego pumping amount that a peak meter will show.

> And if the S-meter dips when you are listening to
> someone else, that person is either overmodulated or his voltage is
> dropping on the peaks.

Not always. Many receiver's S-meter circuits will show forward or
reverse movement with modulation regardless of how proper the
transmitted signal is. Case in point: SBE Console II. That radio's
S-meter would always show a major backswing with modulation. The nature
of the beast. I guess it depends of where they tap the receiver for the
S-meter voltage.

I was curious if Jerry had any figures for his design. I remember reading an article about H.F. antenna modeling on vehicles in QEX a while back. The main thrust of that article was the placement of the loading coil. He was able to demonstrate a marked increase in antenna efficiency when the loading coil was located about midway up the whip.

That's what prompted my question.

> I can give you a "Q" value of my loading coils which approaches 300.

Is that a calculated value or a measured one? A while back I had sent Reg Edwards, in the U.K., a photo copy of Dr. Groves book on inductance calculations, which is out of print, and is very hard to find somebody who has a copy. He uses the tables and equations in that book to do the inductance calculations in the free Ham Radio programs he has on his web site. Did you use any of his software when you did the design?

> NO mobile antenna is efficient when compared to the standard benchmark of

> goes to "sleep". Nothing else
> is needed-the rig automatically resumes the operate mode. Pretty neat,
huh?

Yup, except when you want to change bands then it takes a while for the antenna to retune because the motors used are not that fast.

> While I have no facts and figures, I know from experience what they will
do.
> They aren't all over the ham websites for nothing!

That's why I was asking. I see many claims for them but little hard data on
their design.

but
> i'd expect you to know nothing about it.

Wrong again Tim on both counts. First, the Tech exam is 35 questions, not
30.

http://www.arrl.org/FandES/ead/classes.html

Second, they don't use multiple guess tests anymore for CW, and that was
changed back in July 1, 2001. You must have a solid 25 character count of
copy to pass.

http://www.arrl.org/arrlvec/vex100a.pdf
(look at page two under "Morse code Exam Standards to Change July 1,2001")

You really should research your topic first before you touch that keyboard
that way you don't come off looking so ignorant. I don't mind debating
topics with people, but when the facts are so easy to verify I fail to see
why they don't check first.

Not intending a put-down, Leland, that is not exactly news. The sparkies in the 600 and 150 meter marine bands knew about loading a long time ago. Center-loading requires twice the inductance to accomplish the same effect which does present mechanical and support problems as well as working better. The best shortened antenna is the ancient and honorable Marconi (which might give you an idea of the age) that you see in old movies -- a top loaded vertical. All those horizontal wires are a capacity hat -- the wire that looks like the feed is in fact the vertical element. Put one of those on your 49 Desoto lo-rider.

Back in the days when mobile phones were in the 1600-1800 band and their callsigns started with KL5 giving script writers an entire unused exchange your friendly phone company had the loading problem in spades. They finally just base-loaded them on 12 foot whips and moved on.
There is an old Humphrey Bogart movie where he is a big exec with a mobile phone in a 41 Caddy where you can see one for real.

A properly modulated AM carrier won't "swang" at all, it will stay
steady as a rock. And if the S-meter dips when you are listening to
someone else, that person is either overmodulated or his voltage is
dropping on the peaks.

I remember a paper where someone found an ideal top-to-bottom length
ratio that provided the strongest far-field. As I recall the ideal
ratio was close to 1:1 and there was little deviation when the loading
coil was anywhere close to the center. It wasn't a significant
finding, but if you're interested I can try and find it again.

It's funny how they don't realize that any slight power advantage they
may gain because of calibration tolerance can be easily lost by coax
losses, antenna height, vehicle ground clearance, or any one of a
myriad of other insignificant variables. This RF stuff must seem like
"magic" to them...

Source record: 111697

First of all, Leland, I can't take credit for the design. That goes to Don Johnson, W6AAQ,
of California. The idea of remotely tuning antennas is not a new one--the military was doing it
back in WWII. Don just refined the concept. The first "modern" screwdriver was built of a
2" ID lower mast and a 1 1/2" loading coil of PVC, and was wound with #16 wire at 10 TPI.
Others have built this DK3 (named by Don), and, naturally, began to branch out into other
variations. While quite efficient and a good performer, PVC isn't exactly the best material for
loading coils. It doesn't seem to give trouble at the 100 watt level, but when you begin to
increase power beyond the 250 watt level, PVC will shrink due to heat--and again, that has much to do with the small dia. wire closely wound onto the form. What I did was to change
the coil forms to a more RF neutral material, increase the diameter of the loading coil, and in-
crease the size of the wire to #14. I also reduced the number of turns to 8 TPI. I know the
antenna will handle 800 watts (conservatively rated), and probably more--I just hold the line
at 800 because it gives me a little headroom warranty wise. Besides, not too many hams run gobs of power. Why do that when 100 watts will do? Or even less? A high efficiency antenna
such as the Carolina Cyclone does much to increase one's signal strength without running wasteful amounts of power that only increase your received signal an S-unit or so. What's the
difference so long as your message gets thru, right?

Regardless of what meter you use, knowing you are max'd out on the electronics end of a setup allows you to get to the hardware end. All outputs being the same relatively speaking, it always comes down to SETUP of the installation! Even the crappiest meter on a mobile is still better than none at all.

Adding a capacitor and resistor to the metering function of a wattmeter does
ABSOLUTELY nothing to WHAT it measures, only what MEASUREMENT
it takes.

So, you will read harmonics, splatter, etc. with ANY non-descriminatory type
wattmeter (thats the word you where looking for)

If you want an accurate measure of carrier
> power, however, an RMS meter is what to use for AM.

Get a PEP reading meter. Measure a carrier (Use FM for this, as
it has NO "swing", unless its PM FM).

Now, DON'T TOUCH ANYTHING, but move your Bird from PEP
back to AVG (or put your other meter in line).

Oh look. They are the same. So, it would seem, if you want to measure rms
carrier power, ANY wattmeter will work.

Just using a lot of words doesn't make you look smart. Using a lot of words
for you made you look ignorant, as a matter of fact.

A lot of keyclowns
> don't like RMS meters because the little needle doesn't move and they
> can't figure out how to use a modulation meter. Gotta have that swang!

A. Most "keyclowns" as you call them don't use a PEP meter because the Bird
isn't a pep meter (or it's incarnations). It has nothing to do with
"swing". Proof positive
that you have no clue as to WHO you are talking about, just making
generalizations.

B. Most of the people on the line have negative carrier shift, which can be seen on a Bird
type meter, but usually NOT on a PEP meter, further negating your claims.

Why not just admit you DON'T know the people your talking about, DON'T have a clue
as to what really goes on, and learn from it. You don't have to comment on everything, we
still will realize that you are learning.

Hell, we gave Griffey slack because he was learning, the world will do the same for you.

On a peak reading (true pep meter), a 100 percent modulated am carrier will
increase 4X's.

If that isn't AM swing (from 4 to 16 watts), I dunno what is.

I suggest you check the accuracy of the Swan meter. They have a problem
with falling out over the years. Good meters, as long as you keep them
calibrated.

At the large regional Hamfests I've gone to for the past two years that seems to be the current policy. No Ham ticket, no-transmitter or amplifier, just an equivalent cash prize. And they have it posted right by the barrel where you drop off the ticket stub so there is no excuse for not knowing what the policy is ahead of time.

8-)) Good for you! Many Hams forget what Part 97 says about amplifier sales. If you have one you can only sell it to another licensed Ham, or a Ham equipment dealer. Asking for proof of license is only covering your behind so you stay in compliance with the rules, and avoiding any problems with the FCC.

> A properly modulated AM carrier won't "swang" at all,

An improperly modulated carrier won't swing, either.

The only way you get the carrier to swing is with Suppressed Carrier Amplitude Modulation.

Griffey experimented with it before.

Carriers are just that, a fixed reference used in the demodulation of the sidebands.

Sidebands carry the intelligence, and as such as the only thing that are SUPPOSED to
increase or decrease in power in a properly working am system.

I suggest you learn the fundementals of AM first.

it will stay
> steady as a rock.

On a AVG type meter, yes. On a PEP reading meter, it should increase 4X the carrier power
when modulated 100 percent.

And if the S-meter dips when you are listening to
> someone else, that person is either overmodulated or his voltage is
> dropping on the peaks.

Or, his transmitter is out of alignment. Or he has no headroom because something is being overdriven. Or his antenna is out of wack, causing an improper load on the final, which can cause the same problem.

No, it depends on the type of AGC used in the receiver.

Most SBE radios where made by Cybernet, the PLL02A people. Almost all of
them showed the
same thing.

Guess your theories are already being shot to hell, huh? Hell, you can't
even keep them straight nemore.

Hence the reasoning Sean and Dennis use low pass filters before the meter,
after the amp... As do most GOOD tech's.

Actually, it is all noticed. The only person who DOESN'T seem to get it is the people who haven't done it, and continue to badmouth it.

If all else is equal, who will be heard. The person running 1550 watts, or the person running 1500 watts.

Source record: 111708

You should be able to run 16 to 18 volts. However, you can't run a high reflective power at that setting.

At 13.8 volts, the 2879 will take a high swr (as motorola puts it, 30 to 1, over all phase angles). At 18 volts, it takes a LOT less. This is due to the fact that the RF peak is a hell of a lot higher than the DC voltage component on the transistor CE junction.

Going from 13.8 to 18 volts is almost a double in power.

Hope it helps.

Usually a keydown isn't, either.

YOUR the one that made the corrolary. Don't start taking it apart when it
doesn't fit
your modus operandi now.

lol. Please cite your PROOF.

How many of them check for power on the coax? How many
> of them can tell the difference between power on the coax and power
> from the antenna?

When you have power being radiated from the coaxial cable, you have RF feedback, which
makes your station useless for anything other than a squealbox.

So yeah, its a safe bet that most of the stations that you DON'T hear squealing AREN'T suffering
from INCIDENTAL RADIATION (thats the term you where looking for)

ot many. Care to take a guess as to how much RF
> comes off a vehicle chassis?

Depends on too many factors to make an educated guesstimate here.

>

> Not at all. Again, we were talking about illegal contests, not amateur
> operators, so why you want to compare the two I don't know.

Because your statement was people running 750 watts where going to fry their eyes and testicles. YOU brought up the number. I made a comparison
to another service that has 3db more power output. YOU seem to claim that because
it is another service, it won't suffer the same problems the CBers do. I disagreed, based
ENTIRELY on evidence collected in the field, setting the stuff up.

You make claims that are invalid, never having done so, just to increase the verbiage of your
statements, I am assuming. Otherwise, why keep talking about something you know little about.

Of course, this isn't the first time you have been called on it, is it?

But what
> the hell, right? The amateurs have a couple rules of thumb: Use the
> least amount of power to talk; and, use good engineering practices.
> Keyclowns do neither, so the two cannot be compared. "Que sera sera".

A. You keydown
B. You know keydowners

If you can't answer yes to both, I suggest you stop talking about something you
know little to nothing about (as evidenced by the fact you keep making statements,
and withdrawing them when another radio service is called into the fray)

> >> >Of course, some people choose to do the exact opposite. We don't

Yup, when someone comes to me and lets me know my station is causing a problem, I do
everything I can to fix it.

>
> >If I can fix the problem, I do.
>
> You can prevent the problem before it becomes a problem.

LOL.

As evidenced by the fact I run a complete amateur station, rather than CB garbage on my
own station.

>
> >If the problem is on their end, I offer to help them fix it.
>
> The problem might be on their end, but only if you are operating
> legally.

My license allows me 1500 watts PEP on multiple bands. So, yes, I do
operate legally.

I also operate it on the CB band, which is illegal. I live with the
problem.

You telling me that 1500 watts PEP output on 11 meters is going to cause a
lot more problems
than on 10 meters?

>
> >Instead of sitting here bitching, bringing up problems that less than

I asked you if you worked on something, you claimed something else.

Again akin to that whole 750 watts will fry the testies and eyeballs on 11
meters,
but if a amateur operator fires up his 1500 it won't.

>
> >> >> Not only that, you are perverting the underlying concept of radio

>
> So that's your justification?

Nope. I'm asking you to not infer that CB is the ONLY people that do this, then
put the amateur community as a whole on a pedestal, when it is THE AMATEURS
that brought on Riley Hollingsworth. Remember his title... It isn't special enforcement
to the CB band. The amatuer 75 meter community was making the US look bad
internationally.

They fixed that problem, it seems :)

Suppose you get caught DUI. Don't tell
> me, let me guess: You get behind the wheel when you are drunk because
> people do it every day and don't get caught. Right?

Nope. I don't drink. It makes people stupid.

> You have been listening to twisty, haven't you? I'm not a ham. Shit,
> how many times do I have to say that before it get's through your
> heads...

Nope. And I wasn't inferring that you where a ham operator. What I am inferring
is that you don't know what your talking about. You have proven it with your posts
of "In a proper am system, you don't see your carrier increase...". In an AM system, unless
designed for suppressed carrier am, you don't see carrier increase at all. Intelligence is in the
sidebands, and on a spec-an, the carrier shouldn't increase AT ALL. If it

does, GET RID
OF THE PHASE NOISE!

That is your typical runaway statement. People that care, search google.
Everytime I nail
this moron on a technical level, he runs away stating it isn't worth anymore
of his time.

People like you are eventually found out. Or, they make the experiments,
publish the data, and
admit they learned something new.

Either way, your WAY off base.

Will be glad to not have to argue the point anylonger. You haven't raised a
valid one yet, and it makes
it harder and harder to show the error of your ways the way you DON'T bring
up anything valid.

That's OK. The article I mentioned the author was able to at least publish some numbers showing how much of an improvement you can expect to get. It's one thing to say it works better, and another to say by how much. I'm interested in the "how much" part.

I'll bet the problem with the heating is due to "dielectric heating"
effects. There is a frequency allocation around 13 MHz, I can't remember the
exact frequency, for industrial use. One of those is using RF power to heat
non conductive materials using the above effect. Dielectric heating is the
flip side of the coin to the effect we use in the equipment the company I
work for manufactures, i.e. Inducting heating.

You don't need to be on the highway for that to happen. There is a particular truck that makes deliveries in the area where I work, and when its in front of the building I can hear the driver over the speakers connected to the computer I'm using in my office.

> There are several kinds of interference. One is from modulation
> harmonics, which is called 'splatter'. That distortion stays close to
> the fundamental frequency, but can extend several hundred kHz up -and-
> down because they are carried on the sidebands.

Tech name is IMD, intermodulation distortion, which is caused by nonlinear operation of the modulator and power amp stages. This problem can't be fixed by adding an output filter either.

> Another kind of
> interference is from RF harmonics, which are multiples of the
> transmitted frequency.

Etc. You forgot about reciprocal mixing where one or more strong external signals enter the unfiltered, or poorly filtered output stage, typical of most illegal 11m solid state amps. The signals then mix together with each other, and the regular output signal, to produce a rich mixture of output signals on frequencies you wouldn't even begin to suspect are there until you get the NAL from the FCC, and the knock on the door. Tube amps have far few problems like this because they have a filter by default in the output, which is low pass in nature and also performs the load matching function too. This problem with bite you even if the solid state amp checks OK on a spectrum analyzer because the problem only shows up with an external antenna connected, and other strong signals are near by in the area.

Draw this picture in your mind: When a truck is street-legal it can be
driven on the street. When a transmitter is FCC legal it can transmit
into the airwaves.

It's kind of like walking and chewing gum at the same time, Toll.

Right! Like the military cares about precision! Regardless, the
military has used Birds for many, many years because they are almost
indestructible, and using one type of equipment is how they achieve
"uniformity". Uniformity <> precision.

BTW, what civilian radio shop does military repairs? Are you just
talking mil-spec? How about FCC spec? The FCC doesn't use Bird meters
for their standard. Maybe you can look it up and tell everyone just
what standard they use, just so you don't look like a total idiot.

>
>So yeah, its a safe bet that most of the stations that you DON'T hear
>squealing AREN'T suffering
>from INCIDENTAL RADIATION (thats the term you where looking for)

Wrong again, Toll. You can have all KINDS of RF on your coax and it doesn't necessarily cause feedback. It -can- cause feedback, especially if you are transmitting and receiving at the same time, or if your exciter is poorly shielded or poorly grounded (as most of them are). It can also happen through RF excitation of the microphone, which is really a miniature loop antenna; or through the mic cord, which is more of a helical antenna. (If you do some research, you might find that most professional audio lines are balanced to eliminate any unwanted EM. I haven't seen one CB radio that uses a balanced mic line).

And you totally avoided the questions: How many check for RF on the coax? How many can tell coax RF from antenna RF?

>ot many. Care to take a guess as to how much RF
>> comes off a vehicle chassis?
>
>
>
>
>Depends on too many factors to make an educated guesstimate here.

Well, let's see now. If the system (vehicle & antenna) isn't grounded (as most of them are, because they sit on top of a set of tires), and if the antenna is a 1/4w whip (a basic antennna), then half the power goes out the antenna while half is dissipated by the vehicle. Have you ever seen an AN/MRC-110 or similar military radio? Did you notice how the jeep was grounded with at least a couple ground rods? Why do you suppose they do that? Maybe to get the RF off the jeep and into the air? Naw, that couldn't be the reason...

Toll, you calibrate test equipment against a standard, and a
standardized wattmeter is calibrated with a calorimeter. Ship me yours
and I can standardize it for you.

Most GOOD techs don't usually mess with filters because they are
interested in a clean signal out of the transmitter. And before they
mess with a filter, most GOOD techs will run it past the spectrum
analyzer to see just what needs to be filtered, if anything. And most
GOOD techs are aware that RF harmonics are only part of what gets read
by a power meter, because splatter goes right on through the filter!

>the person running 1500 watts.

All else is NEVER equal, and if you had any experience you would know
that.

And the fact of the matter is that you will hear BOTH signals. Only
with FM will one signal cover the other, and even THEN a fraction of a
percentage in signal strength isn't going to make any difference: Have
you ever studied the mechanics of oscillation? Do you know that once
an oscillator starts, it takes quite a bit to pull it off freq or
phase? When the signal strength is insignificant, the (FM) radio that
will be heard is the one that keys up first.

>Adding a capacitor and resistor to the metering function of a wattmeter does
>ABSOLUTELY nothing to WHAT it measures, only what MEASUREMENT
>it takes.

Where did I say anything like that? I said that a peak-reading
wattmeter measures harmonics and splatter BETTER than an RMS meter.
Which they do. An RMS meter won't move much for a spike, but a peak
meter will pick it up and hold it for you to gawk at.

>So, you will read harmonics, splatter, etc. with ANY non-descriminatory type
>wattmeter (thats the word you where looking for)

I found all the words I was looking for, you just didn't read them
properly. You will NOT read harmonics, splatter, spikes, etc AS WELL
with a RMS meter, as explained before.

>If you want an accurate measure of carrier
>> power, however, an RMS meter is what to use for AM.
>
>
>
>Get a PEP reading meter. Measure a carrier (Use FM for this, as
>it has NO "swing", unless its PM FM).

WTF is PM FM? F3 is frequency OR phase modulation, and they are pretty
much the same thing -- constant amplitude. So what is PM FM and how do
you get "swing" out of it?

>Now, DON'T TOUCH ANYTHING, but move your Bird from PEP
>back to AVG (or put your other meter in line).
>
>Oh look. They are the same. So, it would seem, if you want to measure rms
>carrier power, ANY wattmeter will work.

No shit. But a peak meter won't show if your power is dropping on amplitude peaks, which is an indication of... brace yourself... OVERMODULATION! The only thing a peak meter is good for on AM is to get your jollies watching the little needle move.

>Just using a lot of words doesn't make you look smart. Using a lot of words
>for you made you look ignorant, as a matter of fact.

I really don't care how I look or how many words I use, it's what I am saying that matters. But if you don't use the CORRECT words (PM FM? "Bird" watts?) it can sure make YOU look ignorant, "as a matter of fact".

>A lot of keyclowns
>> don't like RMS meters because the little needle doesn't move and they
>> can't figure out how to use a modulation meter. Gotta have that swang!

>isn't a pep meter (or it's incarnations). It has nothing to do with
>"swing". Proof positive
>that you have no clue as to WHO you are talking about, just making
>generalizations.

It proves squat because I never made such a claim, except to say that my Bird does read peak (which, by the way, is NOT the same as PEP, because PEP can only be measured using a two-tone test; not audio, and not carrier-only (dead-key)). Bird has indeed made peak-reading wattmeters. I own one.

>B. Most of the people on the line have negative carrier shift, which can be
>seen on a Bird
>type meter, but usually NOT on a PEP meter, further negating your claims.

Which is exactly what I stated above.

>Why not just admit you DON'T know the people your talking about, DON'T have

Wrong again, Toll. A carrier is unbalanced by overmodulation. When
that happens it will drop the carrier on the valleys and swing the
average power down.

>Griffey experimented with it before.

That doesn't mean shit. Griffey doesn't even know what AM is.

>Carriers are just that, a fixed reference used in the demodulation of the
>sidebands.

It's obvious that you have never seen an overmodulated signal on a
scope.

>Sidebands carry the intelligence, and as such as the only thing that are
>SUPPOSED to
>increase or decrease in power in a properly working am system.

Sidebands are a function of frequency, Toll. They are created because
as the amplitude of the carrier changes the sine cannot remain pure.
If you filter an amplitude modulated signal down to the carrier,
that's all you are going to get because you are filtering off
FREQUENCIES.

>I suggest you learn the fundementals of AM first.

Speak for yourself.

>it will stay
>> steady as a rock.
>
>
>
>On a AVG type meter, yes. On a PEP reading meter, it should increase 4X the
>carrier power
>when modulated 100 percent.

That's what a peak-reading wattmeter will show. That doesn't mean you are putting out 16 watts. At 100% modulation of a 4W carrier, the audio is only 2W average, and even THAT won't show up on an RMS meter because it's being MODULATED into the CARRIER!

>And if the S-meter dips when you are listening to
>> someone else, that person is either overmodulated or his voltage is
>> dropping on the peaks.
>
>
>
>Or, his transmitter is out of alignment.

Which will cause either overmodulation or a voltage decrease on the peaks, like I said before.

> Or he has no headroom because
>something is being overdriven.

Which will cause either overmodulation or a voltage decrease on the peaks, like I said before.

> Or his antenna is out of wack, causing an
>improper load on the final, which can cause the same problem.

Which will cause either overmodulation or a voltage decrease on the peaks, like I said before.

Maybe you don't understand cause and effect. Or maybe you are just nitpicking...

It could also be due to the non-linear response of the 1N60 used to
rectify the input to the ANL circuit, which is a line that bypasses
the AGC rectifier/filter circuit completely. In fact, that's exactly
what happens in both radios.

>Guess your theories are already being shot to hell, huh? Hell, you can't

As far as they want for the most part. The Ham Radio community has been pressuring the FCC, through the ARRL, to get "specific exemptions" for Ham Radio towers and antennas for a number of years now. To date nothing has happen. The FCC currently feels that PRB-1 is good enough.

The pitfall with that ruling is the FCC only requires local governments to "reasonably accommodate" Ham Radio antenna requirements. That's a big door with lots or room for interpretation. The other pit fall is nothing is mention about antenna requirements that need to be "accommodated" other than Ham Radio, commercial Radio and TV, i.e. no CB specific language is there. That basically leaves you at the mercy of your local building inspector and zoning board.

The link below is for Ham Radio related issues for erecting towers and antennas however you may find something that you can use in the CB arena.

http://www.arrl.org/FandES/field/regulations/antenna-restrictions.html

Of course you can get your Ham Tech class license, which then means you can be covered under the conditions outlined in PRB-1. 8-)) Good luck.

Leland's post is quite accurate. I believe about the ONLY relief is that there is an exemption for the small satellite dishes (such as Direct Tv). Unfortunately, the government tends to protect corporations (in this case, the broadcast industry). It is part of the golden rule: he who has the gold rules. As Leland mentions, even the amateurs have quite limited protection which, as he mentions, is wide open to interpretation.

73 and lots of luck from Rochester, NY

I have no doubt that you build illegal CB amplifiers. I am sure they are capable of lots of power. So if that helps your business, you have my assertions on those issues.

But you -clearly- don't have the proper background, education, experience or responsibility to be building or operating any kind of high-power transmitter, legal or not. If your amps work as you describe, they DO cause problems. While those problems might be small, and you may not have heard about any or all of them, they do happen. Amps may have already caused -larger- problems, but because of the nature of radio the cause may not have been obvious, or it might have even gone undetermined. But you don't know and you don't care, just as long as they don't find out you caused it, right Toll?

Like I said before, it's called 'graveyard legislation'; it's most certianly not the best method, because people have to die before anyone takes notice. So do you want to be the first one to stop a pacemaker? Or crash a helicopter? Is running illegal power so important to you that you are willing to take such risks with other people's lives? Because if you run as much power as you claim, then it's only a matter of time.

Or, if you really want to continue with this stupidity, I can keep showing everyone just how much of what you say is true and how much is your own made-up bullshit. That sounds like a much better plan to me, don't you agree?

I spent several years on the local planning and zoning commission and continue to be involved in local government. Here in Texas, ordinances governing construction are enacted by the local city council, not the code enforcement officers. The purpose generally relates to public safety and esthetics. While there must be acommodations made for amateur stations, no such accommodation is required for cb and is rarely offered. Rather than listening to someone verbally quote the book, get a copy of it and read the specifics of the rules so you can comply, or you choose, apply for a variance, but have your ducks and neighbors all lined up before you appear before the board.

FireStik KW series antennas are pre-tuned at the factory for 27.43 MHz. I have used KW-7's for the past 11 years. Of the 5 I've owned, used, and installed for other people, they have always had an SWR of 1.3:1 or less throughout the 40 channel CB band when tested and burned in on my properly grounded through hole mount.

I was given a KW-3 by a ham, I had to add some wire to retune it to CB because he had used it for 10 meters. He most likely was unsatisfied with the performance of the 3 footer. I know I am. It has so much less transmit and receive then a 7 footer.

A 6 footer should work good. Someone mentioned that any antenna shorter then 5 feet is useless for CB work. I agree with that.

It is time for the Monty Python big foot. We have one each transmitter 4 watt carrier which can be modulated 100% by a tone. On it is a collector current meter - average, a hot wire (RMS) output meter, and a PEP-reading meter.

1. Dead key. Collector current about 500 ma, hot wire at 4, PEP should be about 6-8.

2. Modulated. Collector current 750 ma, hot wire at 6, PEP at 16

A Plate modulated tube using the conventional transformer would be the same except that plate current would not appear to vary. This is because plate voltage also varies and the current variations under modulation average to zero in a perfectly matched system. Transistors don't give a hoot about voltage so long as it is somewhere between breakover and incineration so they have to be solely current modulated more than likely in several stages. Modulating consecutive stages may well give a bit of swang as a by-product but not a whole lot.

The carrier, given that you have sufficient drive to support the peaks, does not vary or change one whit in the modulation process; nothing is modulated into the carrier. The carrier is simply asked to sit and look stupid while audio is mixed with it producing sidebands. It performs another 'sit and look stupid' while the sidebands are mixed with it to produce audio in a diode detector. It is then shorted to ground via a bypass cap never to be seen or heard of again.

S-meters in audio-derived or partially audio-derived circuits might well show an AGC increase. Given that SBE was SideBand Engineers, this would not be a major shock but other things might do it as well.

Do I hear an Amen?

O.K. New IP address (DHCP worked this time under FreeBSD). New DNS name.
New DNS servers. Took me 35 minutes this morning to figure out my new
settings from the Unix box and change the settings on my Win2K box.

Not one call to tech support!

I am sorry I have yet to see that, I have seen about a 2.82 increase from Bird and coaxial dynamics.

Lets say you have a 100 watt rms reading on a bird under modulation, The deadkey can be any number lets use 50 watts and when you talk the bird holds 100 watts rms, on a bird peak meter you will see about 280 -300 watts peak this is with a transmitter that does over 100% modulation.

Gad, didn't someone tell ya that CBers are supposed to be stupid? Scott, I just hope things go as well for me when I convert my old machine to linux. I'm still trying to get the gosh-awful modem in the new e-machine (now that WAS stupid!) to work properly (sounds like an overmodulated over-echoed echo box). I may just disable the thing and switch the winmodem over from the old one. Maybe I should check the SWR on the phone line? ;-)

First off, (I hate to be the bringer of bad news), e-machines suck. Second, I will only have external modems, USRobotics or better. I only use Intel processors, Intel chipsets and Soundblaster sound cards. Everything works, works reliably and is always compatible. One guy I built a machine for went through 4 win/internal modems before buying the recommended modem. Now He has no problems. Another friend bought a $15 modem. He had 3 other people try to install it before calling me. After uninstalling 50 MB of diagnostic software loaded by a wannabe tech, I was able to make the modem work. Tuesday, I fixed one at a bank that lost it's modem and wouldn't print anymore.

Unix is Unix. There are different flavors. BSD is Berkeley. SVR is AT&T.

The commands are similar, just names and syntax vary.

FreeBSD is available for free download at
http://www.freebsd.org/

All sources, documentation and ports are included.

Linux is a commercial item. As such, you may have to pay for
things that are included with FreeBSD. I had some Unix
experience before, so it was just a matter of adjusting to
FreeBSD. I skipped a few versions between drive crashes. The
new stable version (stable because it is NOT the current
(in test) version) is running just as good as the old version
I was running. All my Intel machines will run months at a time
without a reboot. I use Win2K for my workstation, Unix for a
NAT/firewall device. Keeps me connected, but separate. It's
not as simple or cheap as a cable/DSL router, but more fun.

And just think, I fix cars as well as computer equipment and
anything else that breaks down.

Sometimes I try to over-simplify and some important things get lost in
translation. However, you explained it much better than I ever did.

The point was that it takes 2W audio to 100% modulate a 4W carrier,
and a peak measurement on AM is just a deception.

>S-meters in audio-derived or partially audio-derived circuits might well
>show an AGC increase. Given that SBE was SideBand Engineers, this would

Agreed, but in that case the meter would behave the same regardless of
the station transmitting. Few radios behave in that manner. In the
case of the SBE, the meter circuit is referenced to AGC line, so audio
shouldn't affect it. But the meter circuit uses an unbiased shunting
diode. Pulling the anode off ground and up by Vf should solve the
problem.

I don't build for other people. Please don't assume otherwise.

>
> But you -clearly- don't have the proper background, education,
> experience or responsibility to be building or operating any kind of
> high-power transmitter, legal or not.

Judging from the certificates on my wall, the federal government
believes different.

Judging by some of the far-flung stretches you have attempted,
I hope your not.

If your amps work as you
> describe, they DO cause problems.

Please provide proof. I'm tired of having to defend your vaguities
and generalities.

Unless you can provide proof, your a windbag!

While those problems might be small,
> and you may not have heard about any or all of them, they do happen.

Again, a vague statement that nobody can neither prove or disprove.

However, most all people in my area know that I operate radio, and
on the slim occassions when testing something new, etc., I have had them
come and talk to me. Problems where solved.

With all your storytelling, it seems you couldn't find the rfi problem, much
less fix it. You seem to think that if their IS rfi, it is unfixable.

> Amps may have already caused -larger- problems, but because of the
> nature of radio the cause may not have been obvious, or it might have
> even gone undetermined.

lol. More vaguity, and what ifs. What if the sun didn't rise tomorrow.

Would it still be daytime?

But you don't know and you don't care, just as
> long as they don't find out you caused it, right Toll?

Yes, I do know, because I ask around.

Simple as that.

>
> Like I said before, it's called 'graveyard legislation'; it's most
> certianly not the best method, because people have to die before
> anyone takes notice. So do you want to be the first one to stop a
> pacemaker?

Sure. On 11 meters?

Sorry, but my coax is sheilded better than the microwave ovens of
past.

> Or crash a helicopter?

I operate nowhere near any type of ILF equipment.

Either in proximity or frequency.

My spectrum analyzer PROVES that. You make claims, but I seem
to have all the proof. Anyone else see the trend unfolding?

Is running illegal power so
> important to you that you are willing to take such risks with other
> people's lives? Because if you run as much power as you claim, then
> it's only a matter of time.

Sure. And it is only a matter of time before someone goes driving by
a commercial radio station (they use the entire tower, not just an
antenna mounted on top, THE ENTIRE TOWER) and the same thing
happens to them.

As a matter of fact, that would be more likely, since you get more
radiation from the antenna than you do from my coax / hardline.

>
> Or, if you really want to continue with this stupidity, I can keep
> showing everyone just how much of what you say is true and how much is
> your own made-up bullshit.

So far, I have proof, and you have generalities, maybes and what if's.

The people will decide who is more credible.

Yes, sometimes you do... Or you end up changing things to fit your story.

Although you do sometimes know what your talking about, you have a real
tendency to
really stretch things when called out on the mat.

> The point was that it takes 2W audio to 100% modulate a 4W carrier,
> and a peak measurement on AM is just a deception.

Laws of Physics are a deception now.

It takes 2 watts of AVG audio power to modulate a 4 watt carrier.

Check the peak to peak voltage, and do the math.

Does that not kinda blow away your theory that Peak Envelope Power
in an AM rig is a useful measurement? The fact that it actually IS
measuring
the max signal?

Over 100 percent modulation, unless you clip completely the negative peaks
below 100 percent, you will actually lose power output.

Case in point. Cobra 148, limiter removed. Give it a steady state tone
(ahhh, if you will), and slowly back the dynamic down.

On an average reading meter, especially, you will see the rf power go UP as
the dynamic goes DOWN.

Get a good compression style or negative peak clipper in line, and this
phenomenon isn't the case.

> meter will pick it up and hold it for you to gawk at.

With a true rms reading meter, you get no needle flicker at all when 100
percent modulated
or less, on a true am signal.

So, I guess, a needle that did no movement would be better? So you couldn't
see if you had a problem
with modulation, etc?

>
> >So, you will read harmonics, splatter, etc. with ANY non-descriminatory
type

> much the same thing -- constant amplitude. So what is PM FM and how do

> you get "swing" out of it?

You know exactly what I referenced. Just as you knew exactly what a Bird watt
was when I used the term earlier.

However, in phase modulation, you can see a downward pulling effect, following
modulation peaks. Reference early Galaxy chassis.

>
> >Now, DON'T TOUCH ANYTHING, but move your Bird from PEP

> OVERMODULATION! The only thing a peak meter is good for on AM is to
> get your jollies watching the little needle move.

And an RMS meter will show you nothing up to and including 100 percent modulated
signal.

An AVG type meter will. It will show you similiar to the Bird meter.

>
> >Just using a lot of words doesn't make you look smart. Using a lot of words

> wattmeters. I own one.

They have made a few. The Bird models most CBers use are not PEP reading, and most of the operators that have installed the peak reading kit either sell the meter, or take it out because of battery consumption or reliability problems.

The 4314 was pep reading from the factory.

PEP is a measurement of power, yes. It is also the label put on a front of quite a few wattmeters.

And the argument was never brought up as to nomenclature of meters and their labels until now... Why?

it. You don't have to comment on
> >everything, we
> >still will realize that you are learning.
>
> I earned my degree

Ahh, here is one point. Degreed. I am impressed by your staying in school long enough to get the degree. Anything else, impresses me not.

(BTW twistie, electronics engineering is a
> specialized degree), and I have been working with RF professionally
> for over 20 years, in both the military and commercial sectors.

Great. When is the last time you ran a 2SC2879 at 22 volts?

Unless you have experience in the world in which the keydown people operate, you have little experience. A lot of people here argued the points your arguing, including me, until they actually sat down, and tried some of the things being mentioned and talked about in here.

Textbooks don't always follow true when you break from the textbook designs and rules.

I came
> to this newsgroup because I enjoy CB radio and I thought I could share
> a bit of my knowledge and experience, as well as learn some things
> about the hobby.

Good. But your not learning a damn thing when you tell us we can't possibly be doing what we are doing. Have metered. Have watched.

Your engineering degree means little to nothing in the world of overvolted, negative shift having world of cb radio. Your engineering degree means little
to me regardless. I let the way a person presents themself, proves their theories / statements and the way they consistently tell the same thing.

When someone starts to nitpick acronyms, back up and tell someone they oversimplified and thats why their statement was wrong, it all adds up against that person.

But it's obvious that you want a flame war to prove
> yourself, so I will oblige.
>

Actually, I came back on this newsgroup with the intent of not having any flame wars, since it seemed vooby and most of his croonies left after being uncovered.

You started a flame war with the incessant "WHAT IS A BIRD WATT", when you knew damn well what the reference was to.

Get off your "I am an EE, and that means I'm right" attitude, and people will
like you a lot more. And, as you said you wanted, you just might learn something.

Most good techs in the CB community Don't have a spec-an, Don't have the equipment you talk of, and CAN'T do what you say they should.

Now what?

They make do with what they have, ensuring they get the best sample and most accurate readings they can.

Sorry if we aren't good enough for you. I mean, we ARE just lowly CBers.

For once I totally agree with you. Toll. Here's something to read.

-Aaron-

RULE 10 - Power Output
{A} Your CB station transmitter power output must not exceed the
following values under any conditions:
AM [Amplitude Modulation] - 4 watts carrier power [CP]
SSB [Single Side-Band] - 12 watts peak envelope power [PEP]
{B} If you need more information about the power rule, see Part 95/
Subpart E.
{C} Use of a transmitter which has carrier [CP] or peak envelope power
[PEP]in excess of that authorized voids your authority to operate the
station.

RULE 11 - Linear Amplifiers
{A} You may not attach the following items (power amplifiers) to your
type-accepted CB transmitter in any way:
[1] External radio frequency [RF] power amplifiers, also called linear
amplifiers, or linears;
or
[2] Any other devices which, when used with a radio transmitter as a
signal source, are capable of amplifying the signal.
{B} There are no exceptions to this rule and use of a power amplifier
voids your authority to operate the station.
{C} The FCC will presume you have used a linear or other external [RF]
power amplifier if-
[1] It is in your possession or on your premises; and
[2] There is OTHER EVIDENCE that you have operated your CB station
with more power than allowed by CB Rule 10.

Still looking to justify your freebanding eh, Twist? Why not call the
FCC and ask them to give you some details of the 400,000 CB-related
interference complaints they receive every year? Can't? Won't? Oh
yeah, I forgot, according to you there ARE no serious cases of CB
interference.

I can't believe it. I go away for a while, and when I come back you guys are still beating the same old keyclown "who kin git da biggest power" issue to death. Well at least you've got the good sense to realize your fixation with "big power" is related to your subconscious wish for a "big johnson" :)

After a short hiatus of busting eBay auctions of keyclown gear and sending tapes of 10 meter bootleggers to Riley I decided to drop back into rec.radio.cb and check up on my old pals. And what do I see? The same old crew of hardcore keyclowns (Tim, Twisted, Toll, Landshark, Scott, Jay, etc) hard at work undermining the betterment of the Citizens Band with their outlaw cheerleading rhetoric (use amps! operate out of band! screw the rules! yeah!). Sigh. Oh well. Guess I'll have to stay a while.

well,
your best bet as far as kicking up the range, get a good antenna.

if car or truck mount, a 1/4 wave whip mounted on the bumber will work
ok.

if house mounted, a mast of 20 feet with a 5/8th wave groundplane antenna
(basic model) will work nicely. An antron-99 is basically this (with a
matching system in its base to give proper match to the band).

You might also check out some books on antenna design at the local ham
radio store (ham radio outlet or amateur electronic supply). even radio
shack may have something you need in the way of books on basic antenna
design.

point I am making here is: go with what works best for your operating
situation and for pete's sake, stay away from amplifiers. they are a
dirty mess anyway.

An Antron-99 is a dipole and as such has problems with current
on the coax shield. These currents radiate from the coax leaking
into everything the coax runs near. Use an aluminum ground plane.

1505. Retread newbie looking for advice

Newsgroup: rec.radio.cb
Date: 2002-01-11 13:40:45 UTC
From: Ed Swank <eswank@duke.edu>
Message-ID: <a1mq14$li0$1@news.duke.edu>
Source record: 111792

I wanted to get into radio again after a 25 year absence. I was looking to start with a SSB CB radio just to get my feet wet again (I don't want to jump into ham quite yet until I gain an understanding of it. You ham guys don't need anymore newbie idiots do you? :-)).
Anyway, I am a bit confused about radios in general. Now this 11 meter mess folks refer to, is that a 2 meter or 10 meter radio that is transmitting on CB/SSB channels correct? This is illegal? Or, is it CB radios transmitting on the Ham frequencies just above and below the CB's 40 channels? I know thats illegal.
I'm asking because if it's okay to use some type of Ham radio on CB/SSB, then it would be smarter to buy one of those radios for future Ham usage. I don't want any amplifiers or funny business with this, and I don't need to talk half way around the world. Some local chit chat and maybe another radio in the wifes truck for communication.
Antenna....On my truck, I guess it would either be a mag mount Wilson 1000 or maybe a permant mount in a stake bed hole or somewhere else on the truck (Ford F-150). Any suggestions for antennas? I would prefer a permanent mount, but I'm not sure how to mount it. I assume that those aluminum toolboxes don't make for a good ground? I have one of those in the bed bolted in.
Radio wise, I was thinking of a Galaxy 949 or a Midland 72-290. Any opinions on these?
Thanks in advance for any help.
P.S. - I just joined this newsgroup today, but I'm slightly disappointed by some of the posts. I was hoping for more of a community than a bitching party. Is this what I have to look forward to when I get a radio? Sorry, just my observation.
Anyway, again, thanks to all that wish to help me get back into this (without any flaming or smart a** replies, of course).

Sounds to me like you have it pretty nearly right. There is, after all, no prohibition against doing them both.

I have a friend with an F-150 and the inevitable toolbox that has a 102" whip on the box and loads it with a tuner behind the seat from 75 meters up. What he did do is open the coax and ground it to a seat bolt, said seat bolt also being the ground for the tuner. Works like a champ. Another guy does essentially the same thing on an S-10 but uses the resonators and the autotuner in the rig. Decoupling by way of the added ground is the key to this caper but it works champishly. Weather-proofing can be a problem tho.

Don't confuse newsgroups with real radio.

Using a ham transceiver on CB SSB is not legal but it is done and is probably preferable to a lot of the crapola that does show up in terms of spectral purity. As there are bandpass filters in the rig, it is not a great idea to stray far from the reservation however.

Should you be of the Amateur persuasion, and everyone is a rookie once and often for several years - in my case about 46 -- I will give you three websites to keep in mind:

http://www.arrl.org
http://www.qrz.com for the sample exams.
http://ah0a.org for a good code generator Morse Academy. The ARRL code CDs come well-recommended by a few groupies that have done the Extra Class thing lately.

Use my e-mail if you wish. I am not recruiting but if I can be of some help, use me.

If talking with your wife is a major consideration, consider getting both of you the Codeless Tech license. This is often sold as the entry-level ticket but really is not, it is in a lot of cases a bread-and-milk license and you seem to qualify. With a repeater coverage is easy, and 6 meters offers essentially the coverage of CB with the quietude of FM. When you see the sample exams on QRZ.com you will see it is not that big a problem and the ARRL publishes a good book on it.

Welcome back to the ranks of the radioactive.

Source record: 111799

I wanted to get into radio again after a 25 year absence. I was looking to start with a SSB CB radio just to get my feet wet again (I don't want to jump into ham quite yet until I gain an understanding of it. You ham guys don't need anymore newbie idiots do you? :-)). Anyway, I am a bit confused about radios in general. Now this 11 meter mess folks refer to,

-
The "mess" is only propagated by cb haters, in here they are easily identified by their "google.com" posts.
The "problems' referred to by these few are almost nonexistent and exist mostly in their fragile minds and fractured egos.
-
is that a 2 meter or 10 meter radio that is transmitting on CB/SSB channels correct? This is illegal?
-
Yes, transmitting on ham bands when one is not licensed is illegal.
Transmitting on 11 meter with a ham radio is also illegal.
-
Or, is it CB radios transmitting on the Ham frequencies just above and below the CB's 40 channels? I know thats illegal.
I'm asking because if it's okay to use some type of Ham radio on CB/SSB, then it would be smarter to buy one of those radios for future Ham usage.
I don't want any amplifiers or funny business with this, and I don't need to talk half way around the world. Some local chit chat and maybe another radio in the wifes truck for communication.
Antenna....On my truck, I guess it would either be a mag mount Wilson 1000 or maybe a permant mount in a stake bed hole or somewhere else on the truck (Ford F-150). Any suggestions for antennas? I would prefer a permanent mount, but I'm not sure how to mount it. I assume that those aluminum toolboxes don't make for a good ground? I have one of those in the bed bolted in.
-
Actually, those boxes can make for a fine location for a super coil antenna that looks like it's on steroids. For what you want it for, go with the Wilson, it's tried, true, and a proven performer.
-
Radio wise, I was thinking of a Galaxy 949 or a Midland 72-290. Any opinions on these?
-
For your stated purpose these should be just fine.
-
Thanks in advance for any help.
P.S. - I just joined this newsgroup today, but I'm slightly disappointed

by some of the posts. I was hoping for more of a community than a bitching party. Is this what I have to look forward to when I get a radio?
Sorry, just my observation.
-
Good observation. The bitching and discontent all comes from one faction made up of a few
miserables that try to give the impression
of many. There is plenty of support among these pages and plenty of great folks. Learn to killfile the stuttering Johns whose posts are usually putdowns, insultive and rude and your experience can be quite the pleasurable one.
-
Anyway, again, thanks to all that wish to help me get back into this (without any flaming or smart a** replies, of course).
-
Welcome back.

Pop Comm? Isn't that the same magazine you chided and derailed as having
no reponsibility or journalistic integrity?

I chided them for their journalistic "morals".
-
Yes, that is what you said when someone made mention of the fact that
they spoke of keydowns. Yet, here you hold them to a higher standard,
attempting to use the magazine as a pillar of truth to support one of
your opinions, when the actual article you refer has nothing to do with
the horse pucky you were trying to sling concerning cb in NYC.
Embrace, attack, love/hate. Peace out, dude, it's much easier.

That's ok Doc, some people don't understand
it. My mother has always done volunteer work for
the Lucile Packard/Stanford Children's Hospital. She did
the work to help out the hospital before it got a sponsor
like that and she did it to occupy herself for 3 days a week.
She's been doing this for over 30 plus years now and
only recently has she not done it anywhere near as much,
maybe once or twice a month now just consulting.

Hello & Good Morning ED,
Well I see that a lot of people have informed you on
the radio gig, so won't go there. As for the antenna
you might try this:
Go to a local muffler shop, have them bend and
form a proper size pipe to kind of look like a small
roll bar. The trick is you want it to fit in the stake
bed holes on the truck, drilling a couple of holes on
each side to run lag bolts into the antenna bar.
In the center of the bar at the top, you have them
weld on piece of angle-iron approx 4" x 4" with
the hole drilled out in the center for the antenna
of your choice.
I prefer one of the loaded types of antenna's, like the
6' quad wound or the 7' skipshooter because they are
a little shorter than a 102" and will give you very close
to the same performance, without hitting low hanging
objects. If you would like I can send you some pictures
of that same set up on my truck, up to you.

That doesn't make any sense. You measure AM with an RMS meter and
modulation with a -modulation- meter. Works pretty good, don'tcha
think?

It helps. It also doesn't lead a perspective buyer to believe that the
radio is actually putting out 16 watts. RMS is the standard by which
AM power has been measured since it was first measured.

>> >So, you will read harmonics, splatter, etc. with ANY non-descriminatory

I have no idea what you mean by PM FM, but it looks like you are
avoiding the question (hmmm... that's getting to be a habit with you).
And I still don't know what a "bird watt" is because the term has been
used to describe both RMS and peak readings.

>However, in phase modulation, you can see a downward pulling effect,
>following

If you see an amplitude change in PM, then the amplitude limiter isn't
doing it's job. Same with FM.

That's the point. I think you're catching on...

>An AVG type meter will. It will show you similiar to the Bird meter.

...oops, I spoke too soon. For all practical purposes, 'average' =
'RMS'; however, a true RMS meter will show you things that you
wouldn't understand.

>The 4314 was pep reading from the factory.
>
>PEP is a measurement of power, yes. It is also the label put on a front of
>quite a few wattmeters.

You are still confused about PEP and peak-reading meters. PEP is a measurement of power at max modulation. A transmitter or amp has only one PEP value. If a 4W transmitter is capable of 100% modulation, the PEP will be 16W, no less, no more. OTOH, a peak-reading meter will measure power at the modulation peaks (yes, that may be nitpicking, but if you want to avoid arguments you need to get your terminology correct. Like PM FM, and pills, and "bird watts"...)

Regardless, with AM, peak means nothing except that you are modulating, and a modulation meter is better to use because it seperates the modulation from the RF. It also reads it differently and more accurately. If you want "swang", watch the modulation meter.

>And the argument was never brought up as to nomenclature of meters and
>their labels until now... Why?

Because you said this:

>> >A. Most "keyclowns" as you call them don't use a PEP meter because the
>Bird
>> >isn't a pep meter (or it's incarnations).

I have several wattmeters, but I don't think I have a wattmeter that is labeled "PEP". Even the Bird is marked "Peak".

>it. You don't have to comment on
>> >everything, we
>> >still will realize that you are learning.

>> I earned my degree
>
>Ahh, here is one point. Degreed. I am impressed by your staying in school

>long enough to get the degree. Anything else, impresses me not.

I don't care what impresses you or not. You seem to be under the
impression that I haven't been down this road before. I have.

>(BTW twistie, electronics engineering is a
>> specialized degree), and I have been working with RF professionally
>> for over 20 years, in both the military and commercial sectors.
>
>
>Great. When is the last time you ran a 2SC2879 at 22 volts?

Never. But I have overdriven quite a few MRF-450s and 2SC2290s a long
time ago. From that experience I learned (contrary to your
assumptions) that it doesn't make any sense. If you want more power,
use a device rated for a higher power. It's much better to
-underdrive- those things (power RF semiconductors) than overdrive
them because overdriving them increases the harmonics almost
logarithmically. Tubes, on the other hand, usually need to be driven
near max plate voltage for proper operation. But again, overdriving a
tube on the input can distort your signal because of excessive or
changing grid current (Dick can probably explain that better than I
can).

>Unless you have experience in the world in which the keydown people
>operate, you have little experience. A lot of people here argued the points
>your arguing, including me, until they actually sat down, and tried some of
>the things being mentioned and talked about in here.
>
>Textbooks don't always follow true when you break from the textbook
>designs and rules.

No they don't. But your argument is typical of someone that doesn't
have the patience or self-discipline to learn things the right way. In
case you hadn't noticed, textbooks are written for a reason: that
reason being that the information included in them is generally
accepted as factual, and can be proven time and time again. A lot of
people I know have argued the point -you- are arguing, until they
actually sat down and studied the subject in the proper venue -- not
in the CB keyclown arena. Myself included.

>I came
>> to this newsgroup because I enjoy CB radio and I thought I could share
>> a bit of my knowledge and experience, as well as learn some things
>> about the hobby.
>
>
>Good. But your not learning a damn thing when you tell us we can't

JHFC! When are you going to learn to read? I am POSITIVE you do what
you say you do! Now go back and find out what I said!

>Your engineering degree means little to nothing in the world of overvolted,
>negative shift having world of cb radio.

That's obvious. Tell me something I haven't already figured out for
myself.

> Your engineering degree means
>little
>to me regardless. I let the way a person presents themself, proves their
>theories / statements and the way they consistently tell the same thing.

--- Don't stand THERE, you BRAINLESS DOLT, a PIANO is going to fall on
your IGNORANT ASS!!! ---

Would you move? Probably not. Do you care? Probably not. Do I care?
Not in the least. In fact you are behaving just the way I would expect
you to behave. (I'm sure there are quite a few sandbaggers that know
what I just said).

>When someone starts to nitpick acronyms, back up and tell someone
>they oversimplified and thats why their statement was wrong, it all adds
>up against that person.

Hmmm... Well, I could write several pages on how an AM signal is
-really- created, calculus and all, but I didn't think you really
wanted to read all that. If you did, you would have done so already
and we wouldn't be having this pleasant little discussion.

>But it's obvious that you want a flame war to prove
>> yourself, so I will oblige.
>>
>
>
>Actually, I came back on this newsgroup with the intent of not having any
>flame wars, since it seemed vooby and most of his croonies left after being
>uncovered.
>
>You started a flame war with the incessant "WHAT IS A BIRD WATT",
>when you knew damn well what the reference was to.

Quite right that I started it. However, I am still at a loss as to the
generally accepted standard for a "bird watt".

>Get off your "I am an EE, and that means I'm right" attitude, and people
>will
>like you a lot more. And, as you said you wanted, you just might learn
>something.

Get off your "I am a big-time amp builder and I know everything about
RF power amps and I couldn't care less what the book says or how it's
really done I'm gonna do it my way and I don't care what comes out the
antenna I'm just in it for the raw power and that's why I'm so much
better than any EE because I can tweak more bird watts out of a pill
in PM FM mode and those professionals don't know what they are doing

if they can't do what I do so they can't teach me anything and blah, blah, blah" attitude. If you want to be an RF tech, fine. Get up off your lazy mental ass and do it right.

1524. Wanted: Raytheon, Apelco, Webster CB equipment

Newsgroup: rec.radio.cb
Date: 2002-01-11 16:38:07 UTC
From: k5dh@raytheon.com
Message-ID: <PxE%7.271$kY4.5763@dfw-service2.ext.raytheon.com>
Source record: 111811
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.boatanchors,rec.radio.cb

Greetings from the Lone Star State...

I am looking for CB radio equipment by Raytheon, Apelco, and Webster. This would be equipment from 1960 through about 1971. There are certain models that I need for the collection, but I'll consider all models, in any condition, including parts rigs. Also looking for any kind of written information, such as manuals, magazine ads, product reviews, and so forth.

Check out the on-line Raytheon/Apelco/Webster CB Radio Museum at this address:

http://www.qsl.net/k5dh/raytheon.html

Lots of pictures, advertisements, and history.

Before anyone "bashes" me for inquiring about CB gear on the amateur radio newsgroups, I must point out that the majority of the gear in the collection and the majority of the historical information I've compiled has come to me from HAMS, not from CBers.

73,
Dean, K5DH

its sad that hams are so intolerant of each other that a disclaimer of this nature is needed.

Landshark, Since you have a '99 F150 as I do, I would like a pic of that antenna setup if you have one.

Lemmie ask another question.....

As I look more into this, isn't it smarter to buy an export radio (staying off the FM and CW) to use for AM and USB until I decide Ham might be my thing? At least I can listen to the other bands.
Followed by another stupid question.....if I get an export radio, and want to be on the AM/SSB channels, which band would the switch be on? A,B,C, etc. I have searched and searched for info about radios, Ham bands, usage, etc on the web. What I have found, is "CB's for dummies" (no offense anyone), or everyone talking WAAAY over my head with the lingo and tech speak. Hard to find any info inbetween.
Thanks!

Richard, lemme give you a clue. You will note that Google is the source for both of these posts and google is a well-known public urinal.

You will note that it is cross-posted to two groups that have little in common.

So it is a pretty fair bet they are the same guy. They are also ancient history.

Everyone is a rookie once. You have had your once. Then you can fall into the barrel as I have been known to and it will be twice.

OK?

1531. hand held digital tachometer 4 sale

Newsgroup: rec.radio.cb
Date: 2002-01-11 20:19:43 UTC
From: igotmadfunds@aol.communicate
Message-ID: <20020111151943.11305.00001596@mb-cg.aol.com>
Source record: 111818

I have a mint Sticht brand "computak" model CT-2000 digital hand held tachometer. Comes in its own hard plastic case and all attacments and original paper work. This unit can be very usefull for installing after market alternators, and clocking belt speeds. 13 different standard units of measurment. The tool is made of heavy duty metal yet light weight and easy to handle. Required 4 AA batteries.

email all offers to: igotmadfunds@aol.com

Why don't you try and make me SD Jones, why don't you give it a rest you are a nameless nobody, you have done nothing to stop anyone from anything, you haven't ever done anything, so quit trying go get a job or get off welfare. I hear the Houston un employment rate is rising..... no doubt about it....

Wow, you two guys have become the NG POLICE. Good show!

> Of those 75% are forges. Tell me something new.

So besides me, who's not a forge or a troll? Are there any keyclowns
that use google? There must be. Think men, think.

>
> If we all ignore Google postings, they'll go away.

Ignore the trolls, by all means. But when someone (as they inevitably
will) observes that your CB practices are less than legal, don't stick
your head in the sand and cry "Wahh! It's a TROLL! If we ignore it
it'll go away".

If you are going to be an outlaw, at least take the heat for it.

Your buddy,

-Aaron-

Keith he is a nameless nobody in this group no one likes him here he even tries to act like someone important on the CB but as of yet he is impersonating a Keyclown since no one has ever heard of sd jones on the air but he is hiding behind fake names as usual. In Fact he even argues with some of the regulars in here I don't think he is one of the Keyclown cronies.....no doubt about it... they even know how much of an ashole this guy is ...

Can you explain what you are talking about with no needle flicker on a 100%
modulated or less signal whilest using a bird meter on AM.

example 50 watt deadkey un modulated of course, when audio is introduced
bird swings from 50 to 100 watts RMS. am i missing something or is this like
new stuff?

Having a radio doing the talkback thing might make me mad because I'd think
it was mocking
me! LOL!

Seriously, anytime that has ever happened to me, I took it as a sign that
something was wrong--usually a ground loop? I don't want to hear myself
talking thru the speaker because it can mask
a problem.

I like the sound of the Turner +2 base mic on my Kenwood, although I use a 440SAT.

Why?

I have the same capabilities here in San Diego.

Would make no sense for me to send you my slugs, when they would be abused (probably) by the mail service on their way back.... Especially when I can have it done at Cubic for free.

Always used D-104's with my TS450S till I monitored myself through my W2IHY noise gate / EQ box. Although I could easily tailor the D-104 audio with it I have switched to the Astatic Silver Sidebander which EQ's much better and can deliver a wider range of audio profiles than the D-104's.

Now I can transform the transmitted audio from ear-piercing pile-up busting high frequency content all the way through 'normal' and on to the warm, friendly, sexy so-called hi-fi audio many folks like to hear.

I am speaking Mil-Spec.

How about FCC spec? The FCC doesn't use Bird meters
> for their standard. Maybe you can look it up and tell everyone just
> what standard they use,

When I worked at a shop here in San Diego that was legal to recertify
equipment,
we used an IFR. If you would like, I'll stop back by at the shop and get a
make and
model, if they still have the same one.

Been over 10 years, and I have moved on from radio as a professoin to a
hobby. Sorry
if the brands start to slip on something you haven't seein in 10 + years.

>just so you don't look like a total idiot.

>
> Wrong again, Toll.

OK, so when you have incidental radiation from the coax it won't cause a
squeal on
most 11 meter equipment, right?

It can only be one or the other.

You can have all KINDS of RF on your coax and it
> doesn't necessarily cause feedback. It -can- cause feedback,
> especially if you are transmitting and receiving at the same time, or
> if your exciter is poorly shielded or poorly grounded (as most of them
> are).

Actually, squeal on CB comes from little of what you referenced.

Improper talk back adjustment or incidental pickup from the mic cord
are the two most common reasons for squealing on 11 meters, when
running a large amplifer.

I know this from experience.

Please cite your references for telling me I am wrong when dealing with CB
radios.

It can also happen through RF excitation of the microphone,
> which is really a miniature loop antenna; or through the mic cord,
> which is more of a helical antenna. (If you do some research, you
> might find that most professional audio lines are balanced to

> eliminate any unwanted EM. I haven't seen one CB radio that uses a
> balanced mic line).

Then you haven't looked enough. I know of 2.

And thanks for your last part of the paragraph. Where you agree with my
statement.

All your technical jargon and BS preceding it did nothing but cloud the
issue, then
you reaffirmed what I stated.

Nice.

>
> And you totally avoided the questions: How many check for RF on the
> coax? How many can tell coax RF from antenna RF?

no, I didn't avoid the question, I told you it isn't really a problem with
the CB crowd,
and that most don't do it, since it ISN'T a problem.

Besides, the 10 second keys keep most people safe. Look at duty cycle.

That's one thing the opponents NEVER do, is look at the duty cycle.

>

> (as most of them are, because they sit on top of a set of tires),

take a look at my website. Most of the competitors used some type of
ground system either off the bumber, or from bolts through the chassis.

Again, you don't know what your talking about, because you HAVEN'T done
it, don't attend, and have no experience.

Thanks for telling us that we DO what you want, but we are still wrong for
doing
it.

and
> if the antenna is a 1/4w whip (a basic antennna), then half the power
> goes out the antenna while half is dissipated by the vehicle.

Not completely true, but for the most part, yes.

Not everyone uses a quarter wave, either, but for the most part, their
"fighting sticks"
(nothing more than a piece of conduit, copper pipe, etc.... A widebanded
102" whip
in actuality) are.

Have you
> ever seen an AN/MRC-110 or similar military radio? Did you notice how
> the jeep was grounded with at least a couple ground rods?

Have you watched the people at the breaks, when they pull up to the line in
the larger classes
get out of their vehicles, drive the ground rod(s) into the ground whenever
possible?

No, you haven't, because I REALLY don't think you have ever attended a
high power shootout.

Why do you
> suppose they do that? Maybe to get the RF off the jeep and into the
> air? Naw, that couldn't be the reason...

Yup. And the CBers doing the high power RF have known this for years.

Try again.

>

> or Shipwreck is still there? And that place right outside the back
> gate that made such great chili?) But you see, Toll, I grew up.

This means what to the world of high power CB?

People like you come and go over the years. Telling us we can't do what we are, we can't see the numbers we do, and that we can never use any other kind of service because we aren't worthy.

Your an engineer. Your supposed to argue. Thats why God put tech's on the face of the earth. To make the engineers look good because what they design always needs "real world experience" to make it work.

However, please tell me how your knowing about a good place to get chili means you know about overvolting the 2879 and the repercussions. Or running high power rf in a vehicle?

We are still waiting to hear about your keydown times, too.

>
> <snip irrelevant bickering, continue relevant bickering:>
> >> You have been listening to twisty, haven't you? I'm not a ham. Shit,

> >Intelligence is in the
> >sidebands, and on a spec-an, the carrier shouldn't increase AT ALL. If
it
> >does, GET RID
> >OF THE PHASE NOISE!
>
> WTF is PHASE NOISE?

Phase noise is from the VCO / PLL section of a radio.

I suggest you do what you describe to me. A simple search on yahoo or altavista
will tell you what phase noise is, since it doesn't exist in the engineering realm.

It's clear your RF education came from CB radio
> mythology, Toll. You don't even know the correct terminology for what
> you are trying to say, and neither do I! Phase noise? Sheesh..., hit
> the library and figure out what you are talking about, then verbalize
> it in a language more generally accepted than CB jargon. Phase noise,
> "Bird" watts, pills... who makes up this shit?

Again, a simple search on yahoo or alta vista will tell you what phase noise is, and how it
can effect the transmitter.

You think if the drive level in a FM system varies from the tuner (PLL, xtal, whatever) that it
won't reflect on the wattmeter with all the stages of amplification in between?

> >Did it cause problems?
>
> That indicates that either you weren't there or you didn't care.
>
> >I don't think so. None where reported, and I KNOW the sensationalist media
> >would have jumped ALL over it if it had.
>
> Assuming again, Toll?

Nope.

Please show me one iota of evidence that it caused problems.

Until then, YOUR ASSUMING, and since you made the first assumption, the burden
of proof is on you.

Or didn't they teach that in mathematics when you went to school. The burden of proving
the theorum is on the person theorizing, or the ones that come after him.

Im certainly not coming after you, because I don't believe what you say. And so far, you provide
no proof of your claims, either.

>
> >Guess it's not as big an issue as the snivelers would have you believe, is

> doesn't happen, Toll. (And don't even TRY to claim I said any of those
> things are related to keydowns -- they aren't, as far as I know.)

Then why do you bring it up in a thread about keydowns?

Is it common practice for you to start mumbling jibberish in the middle of a technical conversation at work?

> >Do you? No. Have you measured? No.
>
> I have measured MANY transmitters for harmonics. A couple broadcast
> transmitters would have put out hundreds of watts in harmonics if they

> ran full power before they were tuned and filtered.

HAVE YOU MEASURED ANYTHING I BUILT, OPERATED, OR HAD
ANYTHING TO DO WITH.

Doubtful.

Until then, don't comment on what I do, or operate. Its an UNeducated
assumption.

>
> >Have I, yes. Do I build the stuff, yes. Do I have a spec an that I
check
> >it with, yes.
>
> So you measure it. Then what?

If it isn't up to what I want it to do, I go back to the drawing board and
find out why.

If the design is solid, then I look to construction oversights, etc.

You find the problem.

Thats what technicians do... We find out why the engineers stuff doesn't
work.

> >>
> >>
> >> I didn't think so. That's the problem: Nobody seems to care about

> >
> >
> >That is your typical runaway statement. People that care, search google.
> >Everytime I nail
> >this moron on a technical level, he runs away stating it isn't worth
anymore
> >of his time.

Actually, I did respond. And my statement above was in agreement for
another statement you made, concurring with it.

PLEASE go search Google people. He makes arguments, then states he isn't
going to respond anymore, and when he does, HE then jumps all over me for
dropping the subject.

Anyway, when you can get people to agree with you, based upon REAL WORLD
experience, then you have a leg to stand on.

You come up with good information... A lot. Then when you comment on high
power CB (I mean, correctly set up high power, not someone running a

modulator
into their palomar 300A high power), you argue and argue and argue about how
it is impossible that we do what we do.

And when you get called on making the same statements paraphrased over and
over
and over again, you always end up telling everyone that you are done with
it.

Then, when the other person drops the subject, because your a waste of
bandwith and
don't know what your talking about in this one realm of RF, you claim they
ran away.

Anyway

Toll_Free
Still runnin all this steel

some wire facts to toy with.

Where:
R = resistance of conductor in ohms.
P = resistivity of conducting material.
L = lenght of conductor, in feet.
A = area of conductor, in circular mils

R = (P * L) / A

Material Resistivity

Material Resistivity (cmil/ft) In Ohms
Silver 9.9
copper 10.7
gold 16.7
aluminum 17.0
tungsten 33.2
zink 37.4
brass 42.0
nickel 47.0
platinum 60.2
iron 70.0

Huh? A 50 watt carrier modulated 100% with a 1000 Hz tone will
still have the AVERAGE power of 50 watts. 50% of the time the
power will be above 50 watts, and 50% of the time the power will
be below 50 watts. The meter can't move 1000 times a second, so
you read 50 watts, modulated or not.

actually,
"we" don't have to treat you with anything more than minimum tolerance as
fellow human beings (and for some, thats even a stretch).

your continued p[rotests and proliferation of illicit and illegal
activities will be pretty much ignored, save those actions that cause
harm to other services (then the fcc or whatever other governmental
agency in whatever other country will step in and slap you a hard one).

granted, there are a few in the ham community that are bad apples (god
knows we have more than a few here in arizona), but that they should not
be used as examples of good operating ethics.

you wanna operate ham radio, get your damned ticket and quit whining!

Maybe I am missing something or my Bird meter is broke, or someone is in left field. Into a dummy load I hooked up a radio I set the deadkey level to lets say 50 watts for an arbitrary figure when I talk the meter swings up to 100 watts rms max on voice peaks. So what you are saying is that it should not move from the 50 watt level when I talk. Someone had better explain this a little better, how can I have power below 50 watts 50% of the time.

No Scott, the carrier sits there looking stupid and sidebands are added so a 100% modulated AM signal with 50 watts quiet will get up to 75 average under steady tone modulation. Our buddy here has managed to either use some audio to power an increased carrier (swang) or has successfully built an amp that produces more, not just louder, crap under modulation. More than likely he is simply badly overmodulated.

> new stuff?

You are missing something, and it is not new. A 100% modulated signal will
barely cause needle flicker. Why? Because the modulation causes the power
to both increase and decrease equally around the un-modulated reference
carrier level.

Nope. In this case, when you modulate the signal, the carrier level is
also increased. In reality, this "swing" gains you nothing but it impresses
your friends when they see it on their signal strength meters.

This is not the same as modulating a steady carrier - which is what we
were discussing.

To expand on this a bit - that 50% increase is for a modulating signal
that is a sine wave. The human voice is far less efficient - usually
only 1/6th to 1/3rd as good. This means that the average will increase
only about 8% to 17%. So that 56 watt reading will go to 54-58 or so
watts. That is why I stated there will only be a slight flicker.

There are ways to improve this, and keep a clean signal. Peak clipping
will not do it - it creates all sorts of splatter. Audio compressors
are useful, as are methods to reduce the range of audio frequencies in
the audio modulation.

Scott, I bought Mandrake 8.1 for the 400 MHz machine. I haven't done anything yet until I fix the stupid e-machine (see me earlier post, buying it WAS stupid). The e-machine basically works except for the echoing modem. You are correct, hardware modems are far superior to software modems (perhaps not as flexible, but much more reliable). Once I have the modem working, I'll be transferring digital pics and videos into the new machine. Then comes the reformat and Linux goes in. I just may have two operating systems on it - Linux and (hold on to your seat) DOS. I figure I'll just go get an old soundblaster 16 and be able to save some good DOS games as well as have Linux (OK, I like Descent!). I just look at it as a learning opportunity. Why do I get the feeling I am going to be beset with opportunity?

Well, you still avoided the question. What is the FCC standard for RF
power? It's really easy to find. Why don't you ask Voobner to help you
find it, I'm sure he will if you ask via email, and nobody will ever
know that you asked him about something you don't know. Heaven forbid
you should learn something, especially from Voobner!

>It can only be one or the other.

Not necessarily, but it will if it is feeding back through the amp or
radio. You are ignoring the fact that coax can radiate without causing

feedback. But that's what I say here:

>You can have all KINDS of RF on your coax and it
>> doesn't necessarily cause feedback. It -can- cause feedback,
>> especially if you are transmitting and receiving at the same time, or
>> if your exciter is poorly shielded or poorly grounded (as most of them

That's an audio feedback loop, not an RF feedback problem.

> or incidental pickup from the mic cord
>are the two most common reasons for squealing on 11 meters, when
>running a large amplifer.
>
>I know this from experience.

I agree. Didn't I say something to that effect already? By golly I
did, just scroll down a bit:

>Please cite your references for telling me I am wrong when dealing with CB
>radios.

Why? I agree with you on this point. In fact you are mostly just
reiterrating what I already said.

> It can also happen through RF excitation of the microphone,
>> which is really a miniature loop antenna; or through the mic cord,
>> which is more of a helical antenna. (If you do some research, you

>and that most don't do it, since it ISN'T a problem.
>
>Besides, the 10 second keys keep most people safe. Look at duty cycle.
>
>That's one thing the opponents NEVER do, is look at the duty cycle.

So you are saying that "most don't" measure coax RF. Now to say that
it isn't a problem is ignorant, because you don't know if it's a
problem until it has been measured. So the reason it isn't measured is
because: 1) They are not aware of the hazards; 2) They don't care
about the hazards; 3) They don't know how to tell the difference
between coax RF and antenna RF; or 4) You change the subject before
they can measure it?

>ground system either off the bumber, or from bolts through the chassis.

That didn't happen at the one's I've seen. One was a parking lot and
they didn't bother with ground rods, just chains dangling from the
bumpers. At the other keydowns some of them just stuck a few tent pegs
in the ground, and most ran dirt-free. Only once did someone run a
full-sized ground rod -- I won the class!

That's because the vehicle is the counterpoise, and will either
dissipate or radiate (usually both) the other half of the signal. Now
if you are putting out 50kW, and you are either inside the vehicle or
standing close to it, how much RF do you think is going through your
balls?

You are really trying to pull this off the subject, aren't you? Let's
backtrack: You were comparing keyclowns and amateur radio operators,
but you couldn't find any reasonable response to my reply that hams
operate with the minimum power needed and do so using good engineering
practices, which is totally opposite to the nature of a keyclown. Now,
you were saying?

>> >You make claims that are invalid, never having done so, just to increase

U
ACK!! PHPHBT!!

>We are still waiting to hear about your keydown times, too.

Short and sweet: When I was in school I learned a bit of RF from my
uncle, who was a ham. I joined the USMC in 1981 and was trained to be
a radio repairman (2841). I got sent to 3Bn 8th Marines at Camp Geiger
(part of Camp Lejeune) where I goofed off until I was sent to Beirut.
After that I developed a different view on things in general,
including having a bit more respect for the laws and why they exist. I
gradually weaned myself from the keyclown action, and then I went back
to school for my degree. That's all there is. Satisfied?

>>
>> <snip irrelevant bickering, continue relevant bickering:>

>realm.

Oh, it exists alright, but not in the context you used it! 'Phase
noise' isn't going to change your power level at all, unless it is so
noticable that it renders your signal unintelligable. But then you
have bigger problems and your radio isn't going to stay on freq: more
than likely you are going to blow out your VCO (if it isn't blown
already)!

So I'll get back to the question, and this time, because you gave a
lame excuse to avoid the answer, I'll add a question: What is phase
noise, and how does it affect output power? (BTW, excessive output
power can actually -cause- 'phase noise'. Wanna know how? I'm sure you
do, so I'll give you the same answer you gave me: Look it up!)

>It's clear your RF education came from CB radio

If the drive level in an FM (and PM) transmitter varies (and it does
after modulation), that variation should be eliminated by the
amplitude limiter. If you have some AM on an FM signal, the radio
isn't working correctly. Didn't I say that before...?

>> >Did it cause problems?

>
>Im certainly not coming after you, because I don't believe what you say.
>And so far, you provide
>no proof of your claims, either.

Wanna play logic, eh? Well I began asking a question: Did it cause
problems? Your response was, "I don't think so. None where [sic]
reported..." But you left out what agency takes those reports, whether
it's 911 or the media or the FCC. It is more than fair for me to
assume that you didn't check any of them. Then, as your premise, you
state that if the media had received a report that it would be
'sensationalized', which is an assumption on your part. In fact (and
I'm sure even twistie can verify this for you) many, many stories are
reported to the media each day and very few ever make press. So unless
you can qualify your assumption, it has the strength of diluted water.
As my reply I asked if you were assuming, which you were, but you
denied it. So where does the burden of proof lie, Toll?

>
>Thats what technicians do... We find out why the engineers stuff doesn't
>work.

Been there, done that. That's one reason I became an engineer. Some of
the time it's because of planned obsolescense, but usually the problem
is because the company forces the engineers to cut corners in order to

cut costs. Engineers don't like it, but if they want to keep working
they accept it. I wouldn't accept it, that's why I work for myself
now. Not much money, but I have my integrity, and that's more
important.

>> >> I didn't think so. That's the problem: Nobody seems to care about

Ed, Richard McCollum's post is well worth reading. Carefully. I don't know what part of the country you are in, but if there are repeaters anywhere in your area, his suggestion should be looked at carefully. The codeless tech will serve you VERY well for what you are looking for. If there are repeaters in your area (within 40 miles or so), you will find you can maintain communications between two vehicles for close to 100 miles. Clear FM communications. You will also likely have access to autopatches (you punch the buttons and presto - you're into the local telephone lines and can place outgoing calls). Running just my HT (6 aa alkalines) I've talked with other folk running just an HT in Watertown (probably a good 180 miles by road from Rochester). Solid communications. My former neighbor from across the street monitors my transmissions at times - she lives in Wellsville, 110 miles by car and very close to the Pennsylvania boarder. Rochester is next to Lake Ontario. This is NOT skip. This is consistant 24/7 coverage (well, she happens to live on top of a 2400 foot hill, which helps). One of the repeaters (the N2HJD megaplex system) has a 10 meter port on it. I've yakked with Australia - again, solid FM communications. The antennas are quite small. Only several inches for a quarter wave on 440. There are a lot of couples using two meters and 440 for local communications between themselves as well as others. There is no interference. The Fairport repeater has internet linking. The list goes on and on. As Dick mentioned, we all were newbies at one point or another. Virtually anyone should be ready to pass the tech ticket inside of a week if they wish. There is no Morse Code test. Feel free to e-mail me as well. My e-mail in the header is valid. I have nothing to hide.

If possible I'll try to take one Sat or Sunday.
As for the what radio to use..... Here goes:
If you go for any sort of export radio, understand
that if you are using it without a license on a ham
band it is illegal. Also using it modified on the cb
band, with or without a license is illegal. Now that
that's out of the way, I would use the President
2510 or 2600 with the chipswitch and an Astatic
575m6 mic with it set at #3 for mod level. If you
keep the power level down and the modulation
set so that it doesn't over modulate it is a very
good set up. If you also want, I can send you
the set up sheets for the 2510 with the chipswitch.

Hey Scott what did I miss? Not a peep
about what? I don't think I've even looked at
this thread. Boy, the things these guys will say
to get attention :^)
